

Python

functional programming

Functions are first-class objects

Functions can be used as any other datatype, eg:

- Arguments to function
- Return values of functions
- Assigned to variables
- Parts of tuples, lists, etc

```
>>> def square(x): return x*x
```

```
>>> def applicator(q, x): return q(x)
```

```
>>> applicator(square, 7)
```

```
49
```

Lambda Notation

Python's lambda creates anonymous functions

```
>>> lambda x: x + 1
<function <lambda> at 0x1004e6ed8>
>>> f = lambda x: x + 1
>>> f
<function <lambda> at 0x1004e6f50>
>>> f(100)
101
```

Lambda Notation

Be careful with the syntax

```
>>> f = lambda x,y: 2 * x + y
```

```
>>> f
```

```
<function <lambda> at 0x87d30>
```

```
>>> f(3, 4)
```

```
10
```

```
>>> v = lambda x: x*x(100)
```

```
>>> v
```

```
<function <lambda> at 0x87df0>
```

```
>>> v = (lambda x: x*x)(100)
```

```
>>> v
```

```
10000
```

Lambda Notation Limitations

- Note: only **one** expression in the lambda body; Its value is always returned
- The lambda expression must fit on one line!
- Lambda will probably be deprecated in future versions of python

Guido is not a lambda fanboy

Functional programming

- Python supports functional programming idioms
- Builtins for map, reduce, filter, closures, continuations, etc.
- These are often used with lambda

Example: composition

```
>>> def square(x):  
        return x*x  
  
>>> def twice(f):  
        return lambda x: f(f(x))  
  
>>> twice  
<function twice at 0x87db0>  
  
>>> quad = twice(square)  
  
>>> quad  
<function <lambda> at 0x87d30>  
  
>>> quad(5)  
625
```

Example: closure

```
>>> def counter(start=0, step=1):  
    x = [start]  
    def _inc():  
        x[0] += step  
        return x[0]  
    return _inc  
  
>>> c1 = counter()  
>>> c2 = counter(100, -10)  
>>> c1()  
1  
>>> c2()  
90
```

map

```
>>> def add1(x): return x+1
```

```
>>> map(add1, [1,2,3,4])
```

```
[2, 3, 4, 5]
```

```
>>> map(lambda x: x+1, [1,2,3,4])
```

```
[2, 3, 4, 5]
```

```
>>> map(+, [1,2,3,4], [100,200,300,400])
```

```
map(+,[1,2,3,4],[100,200,300,400])
```

^

SyntaxError: invalid syntax

map

- + is an operator, not a function
- We can define a corresponding add function

```
>>> def add(x, y): return x+y
```

```
>>> map(add,[1,2,3,4],[100,200,300,400])
```

```
[101, 202, 303, 404]
```

- Or import the [operator](#) module

```
>>> from operator import *
```

```
>>> map(add, [1,2,3,4], [100,200,300,400])
```

```
[101, 202, 303, 404]
```

```
>>> map(sub, [1,2,3,4], [100,200,300,400])
```

```
[-99, -198, -297, -396]
```

filter, reduce

- Python has builtin for reduce and filter

```
>>> reduce(add, [1,2,3,4])
```

```
10
```

```
>>> filter(odd, [1,2,3,4])
```

```
[1, 3]
```

- The map, filter and reduce functions are also at risk ☹️
