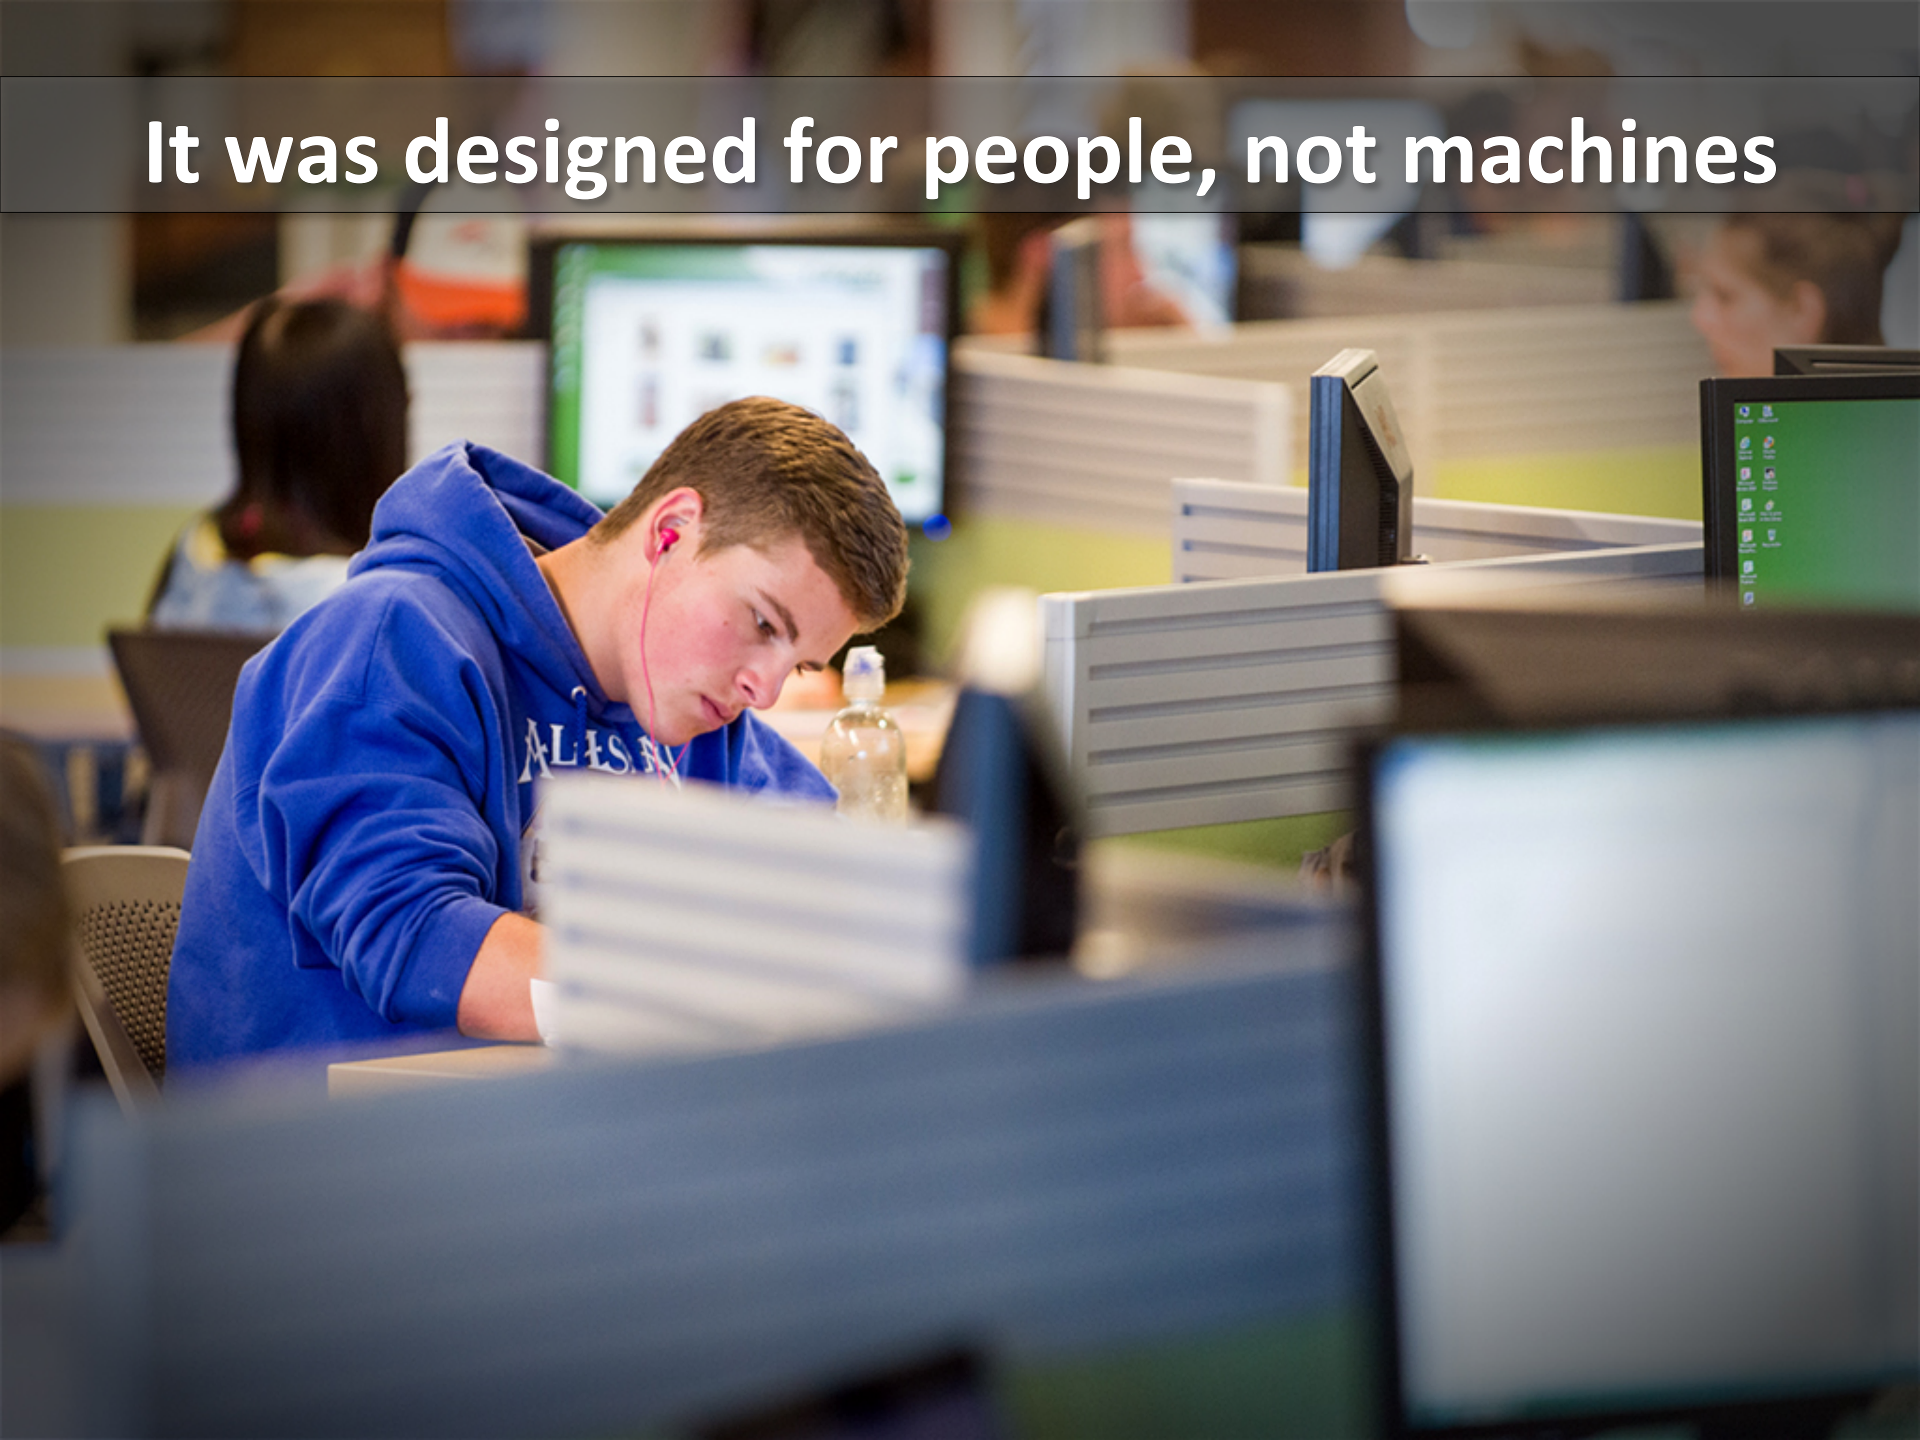
From Strings to Things

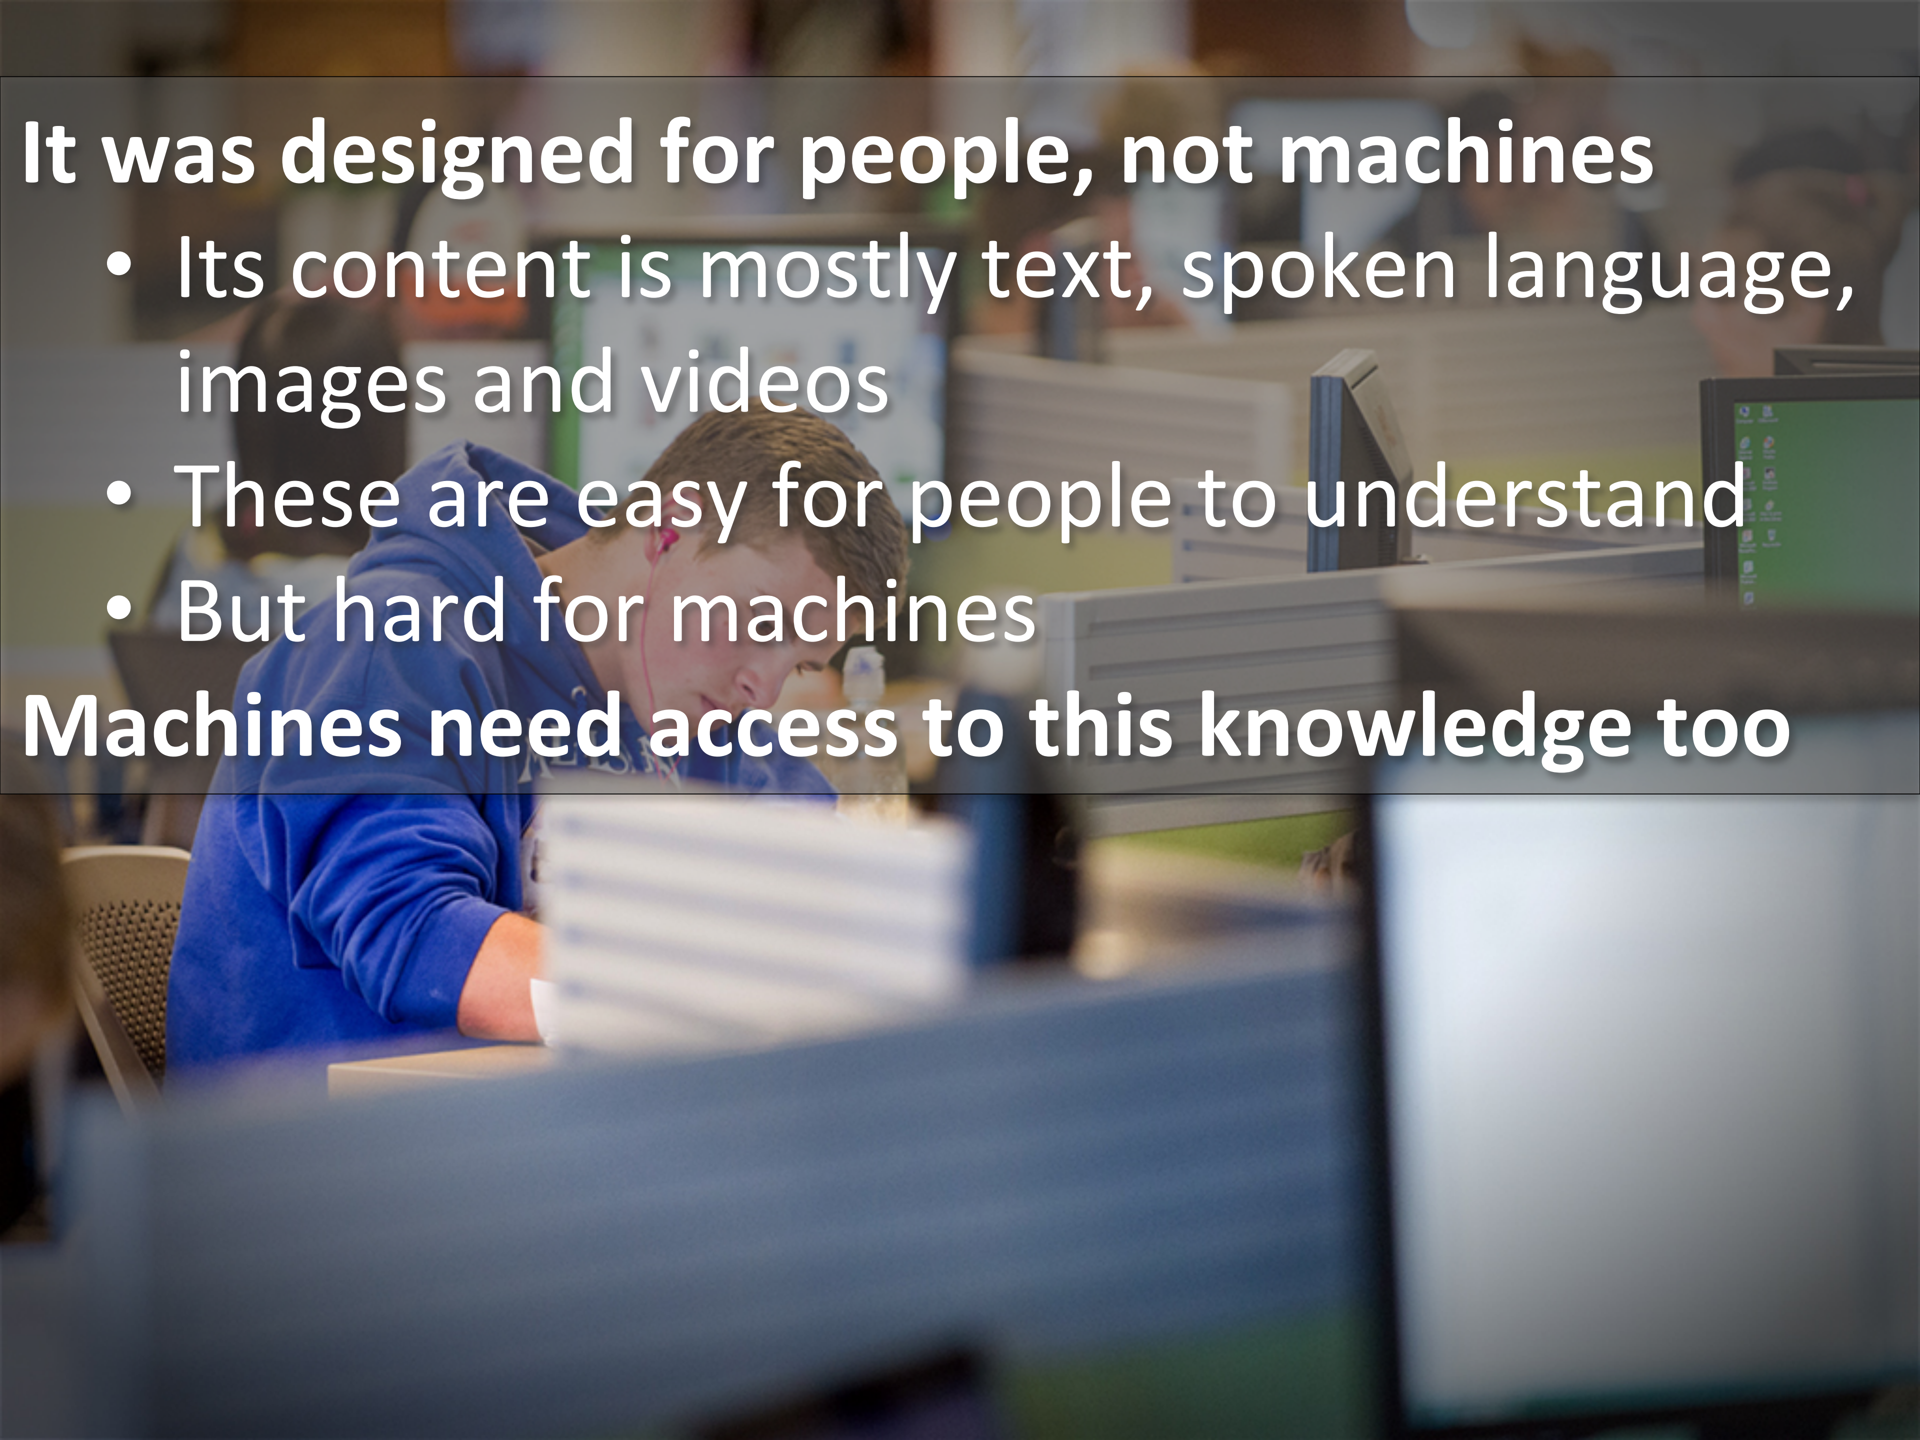
Populating Knowledge Bases from Text

The Web is our greatest knowledge source

But it has limitations

It was designed for people, not machines





It was designed for people, not machines

- Its content is mostly text, spoken language, images and videos
- These are easy for people to understand
- But hard for machines

Machines need access to this knowledge too

Access is primarily via information retrieval

Vannevar Bush envisioned a hypertext/IR system in 1945

Access is primarily via information retrieval

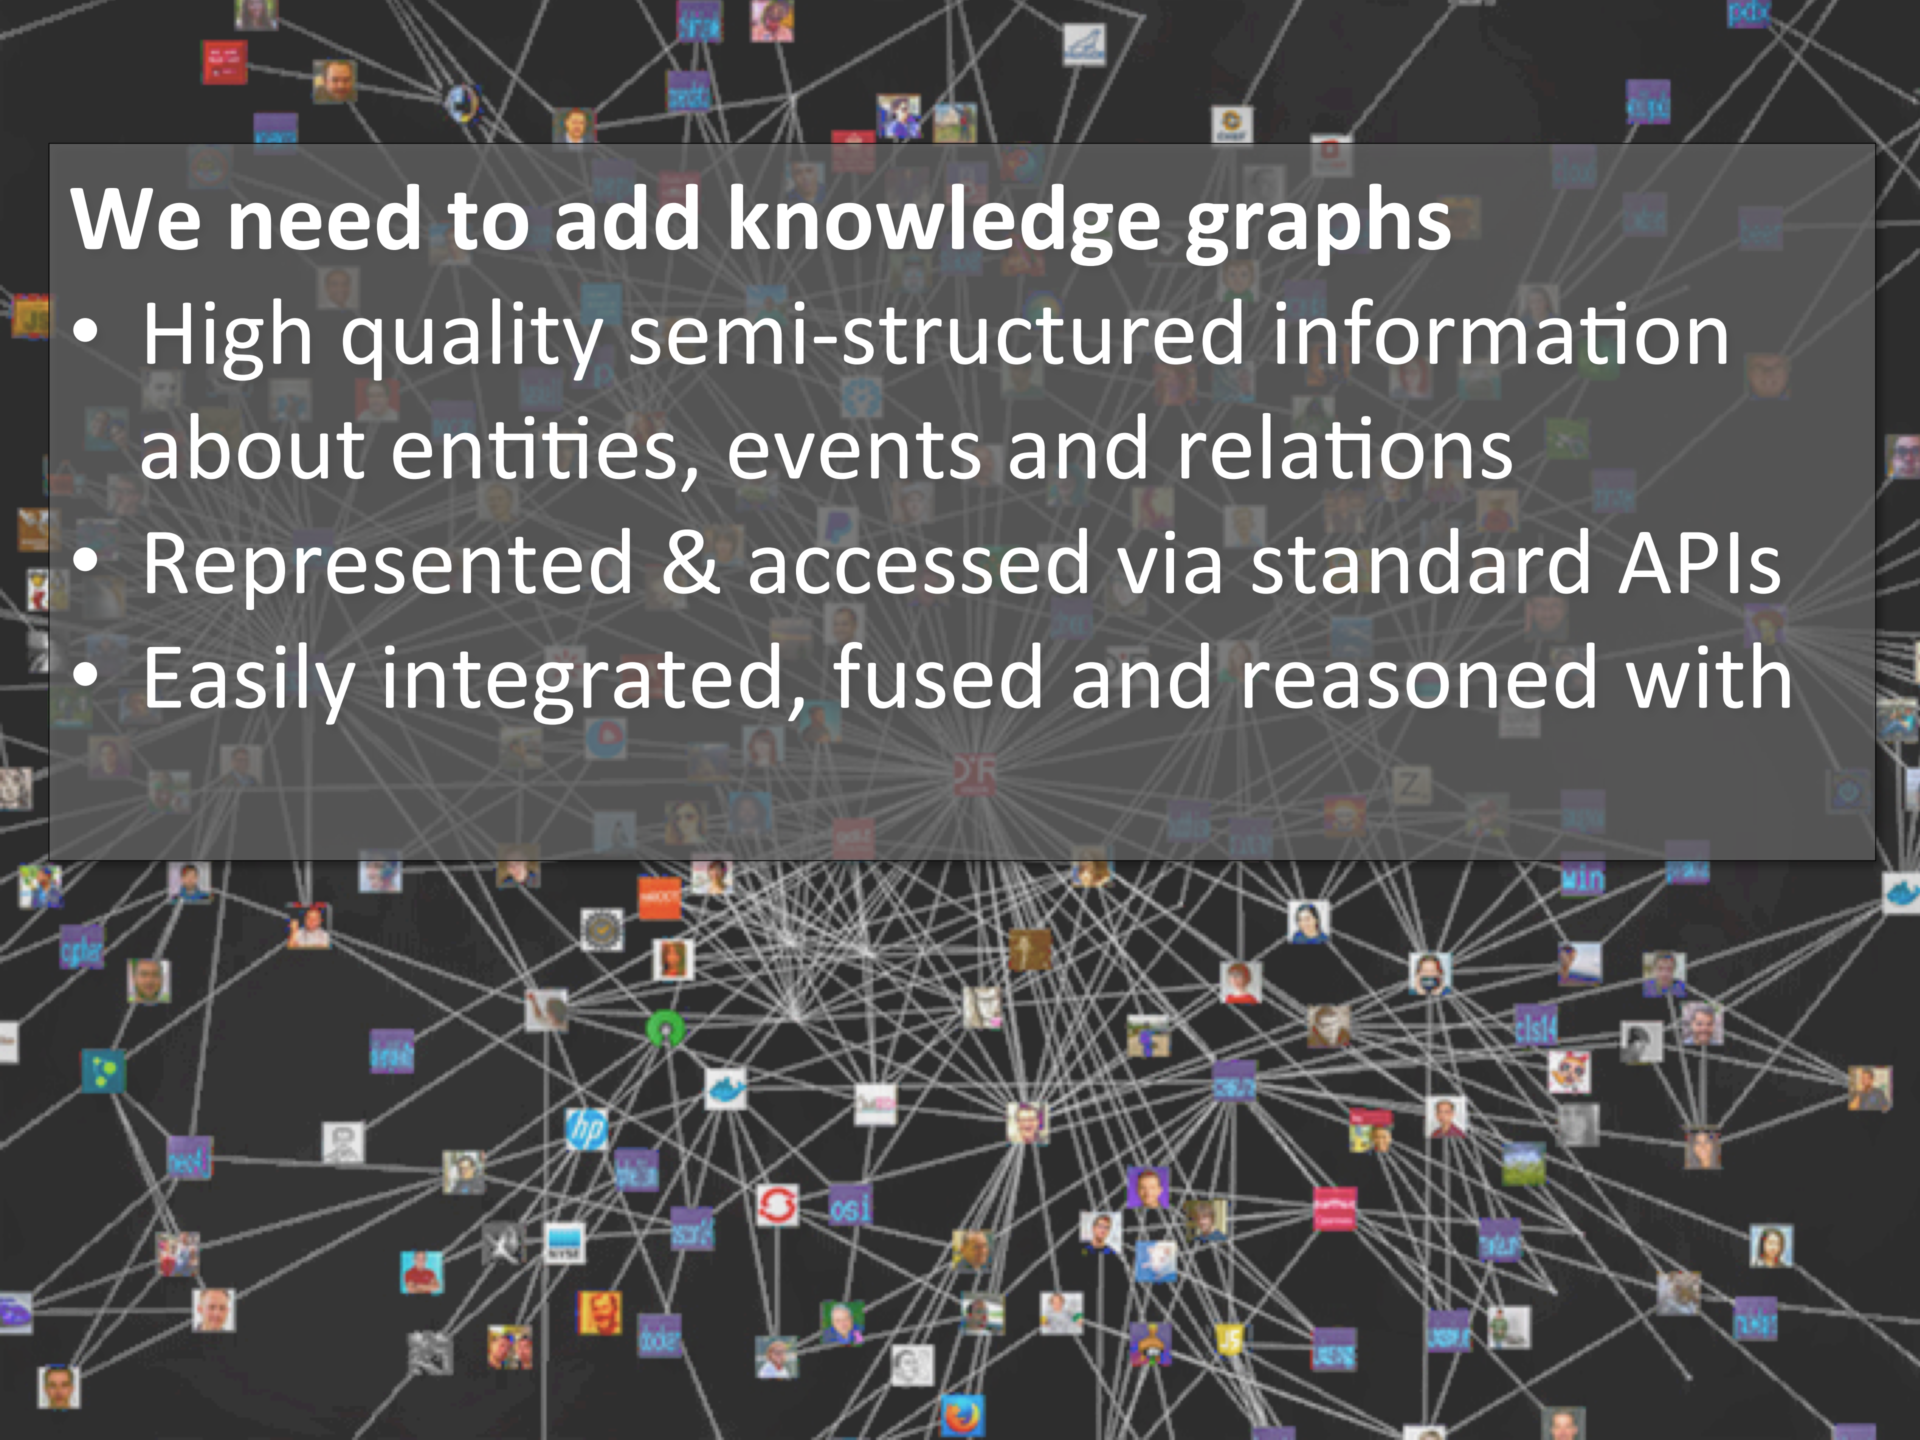
- Key-word queries→ranked document list
- We still need to read the documents or watch the videos
- We often want an answer to a question

And so do our machines and apps

Vannevar Bush envisioned a hypertext/IR system in 1945

We need to add knowledge graphs

fp
osi
win
beer
JS
hp
clsj4



We need to add knowledge graphs

- High quality semi-structured information about entities, events and relations
- Represented & accessed via standard APIs
- Easily integrated, fused and reasoned with

~~Keyword Data~~

State of the Art?

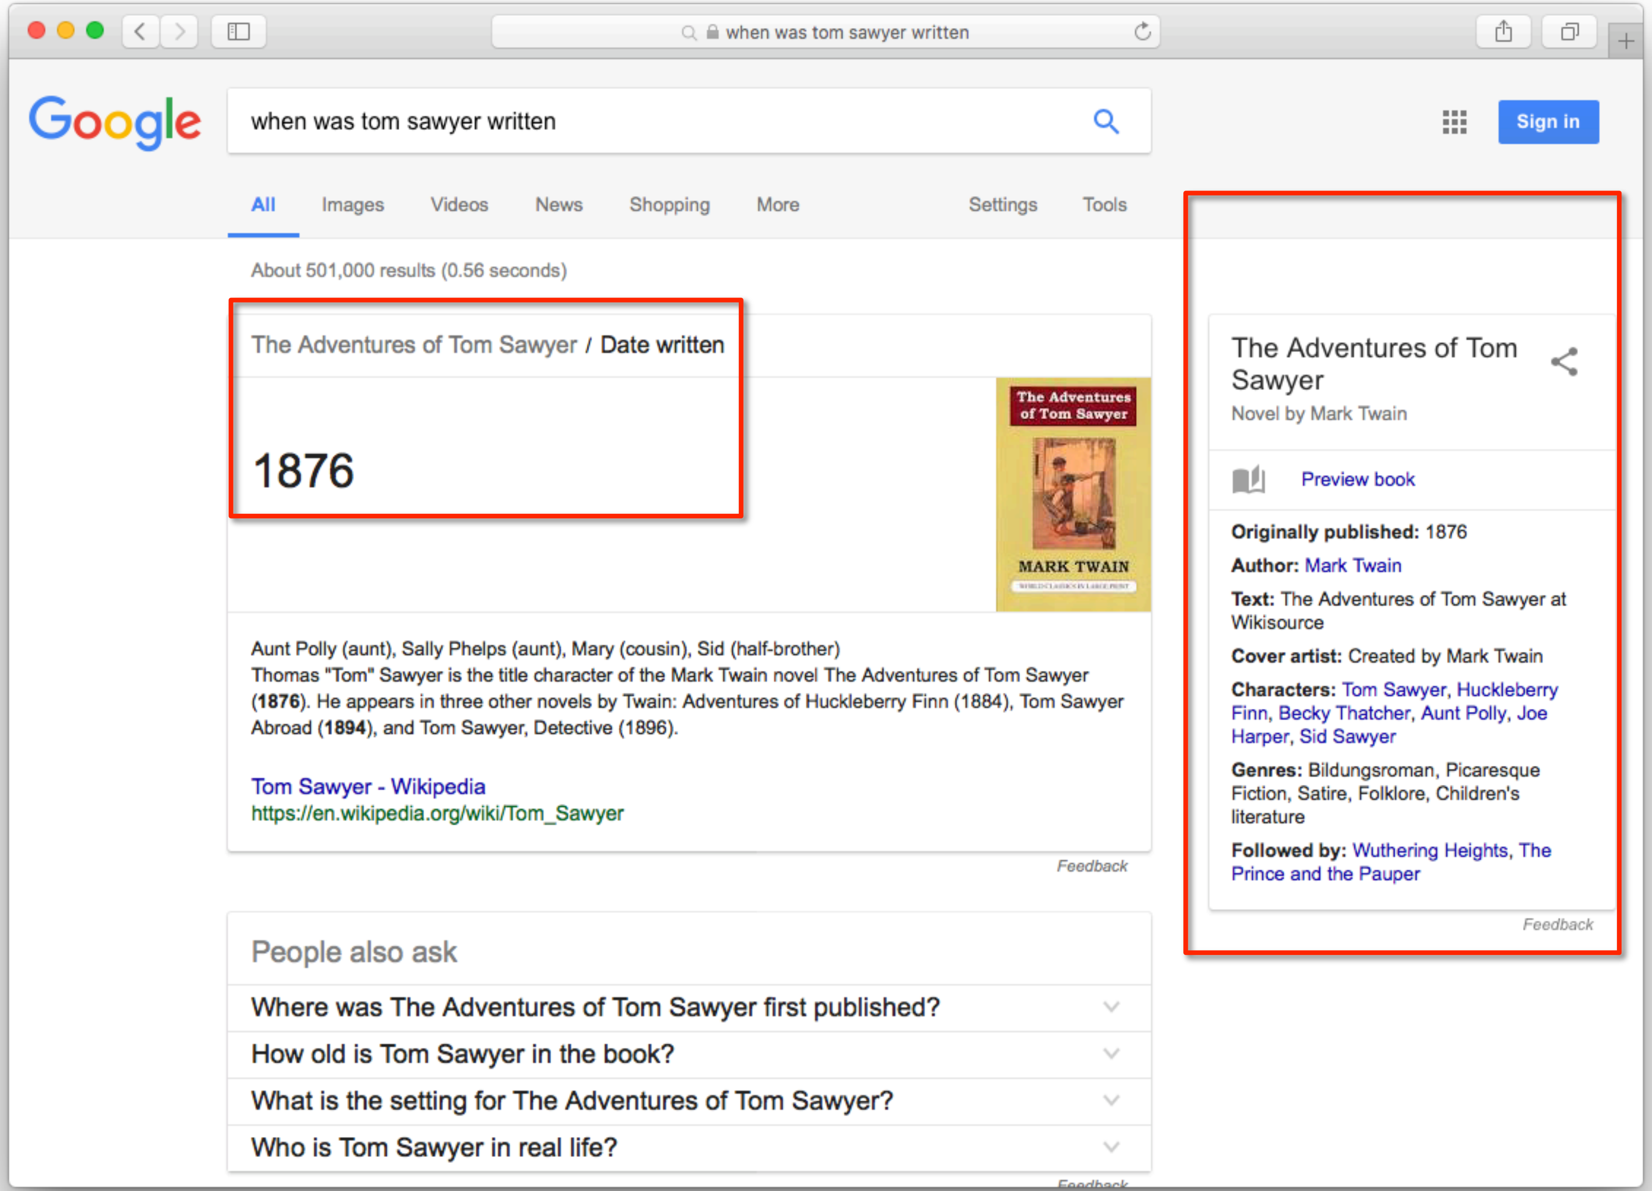
Google is a good example, but Microsoft, IBM, Apple and Facebook all have similar capabilities

- 2010 Google acquired MediaWeb and its **Freebase** KB
- 2014: Freebase: 1.2B facts about 43M entities
- 2015+: Google knowledge graph, updated by text IE

DBpedia open source RDF KB is another

- 800M facts about 4.6M subjects from English **Wikipedia**, data also available in 21 other languages
- Helps integrate 90B facts from 1000 RDF datasets in the linked data cloud

Ask: When was Tom Sawyer written?



About 501,000 results (0.56 seconds)

The Adventures of Tom Sawyer / Date written

1876

Aunt Polly (aunt), Sally Phelps (aunt), Mary (cousin), Sid (half-brother)
Thomas "Tom" Sawyer is the title character of the Mark Twain novel The Adventures of Tom Sawyer (**1876**). He appears in three other novels by Twain: Adventures of Huckleberry Finn (1884), Tom Sawyer Abroad (**1894**), and Tom Sawyer, Detective (1896).

Conversational Bots

Voice-driven conversational systems like Amazon Echo and Google Home use knowledge graphs to help understand our requests

Where does the knowledge come from?

- Initial knowledge graphs like *DBpedia* and *Freebase* started with data from **Wikipedia** and encoded it in custom ontologies
- Current focus is on extracting information from text of source documents, e.g., journal articles, Newswire, social media, etc.

NIST Text Analysis Conference

- Annual evaluation workshops since 2008 on natural language processing & related applications with large test collections and common evaluation procedures
- **Knowledge Base Population** (KBP) tracks focus on building KBs from information extracted from text
  - **Cold Start KBP**: construct a KB from text
  - **Entity discovery & linking**: cluster and link entity mentions
  - Slot filling
  - Slot filler validation
  - Sentiment
  - Events: discover and cluster events in text

http://nist.gov/tac

2016 TAC Cold Start KBP

- Read 90K documents: newswire articles & social media posts in English, Chinese and Spanish
- Find entity mentions, types and relations
- Cluster entities within and across documents and link to a reference KB when appropriate
- Remove errors (*Obama born in Illinois*), draw sound inferences (*Malia and Sasha sisters*)
- Create knowledge graph with provenance data for entities, mentions and relations

2016 TAC C

- Read 90K docu
  media posts in

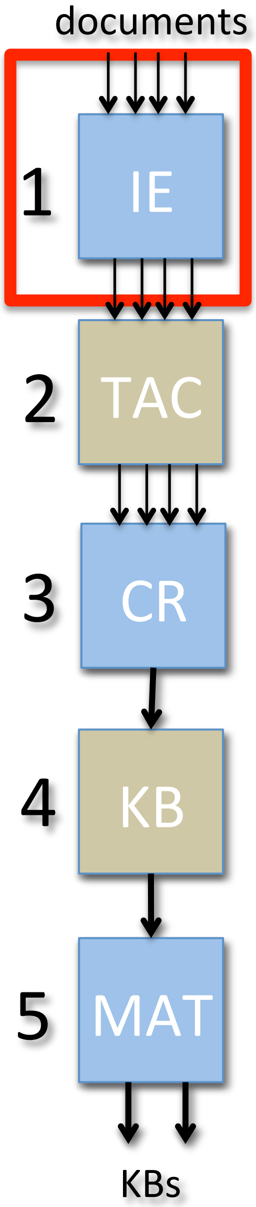
Kelvin

- **KELVIN**: **K**nowledge **E**xtraction, **L**inking, **V**alidation and **In**ference
- Developed at the *Human Language Technology Center of Excellence* at JHU and used in TAC KBP (2010-16), EDL (2015-16) and other projects
- Takes English, Chinese & Spanish documents and produce a knowledge graph in several formats
- We'll review its monolingual processing, look at the multi-lingual use case

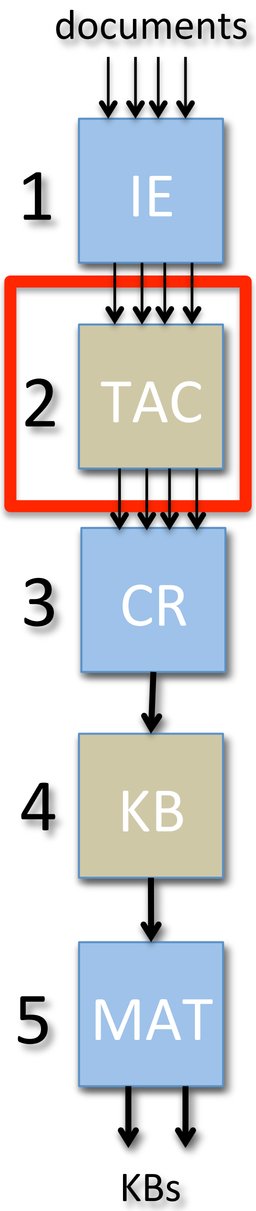
1 Information Extraction



- Process documents in **parallel** on a grid, applying information extraction tools to find mentions, entities, relations and events

- Produce an **Apache Thrift** object for each document with text and relevant data produced by tools using a common **Concrete** schema for NLP data

2 Integrating NLP data

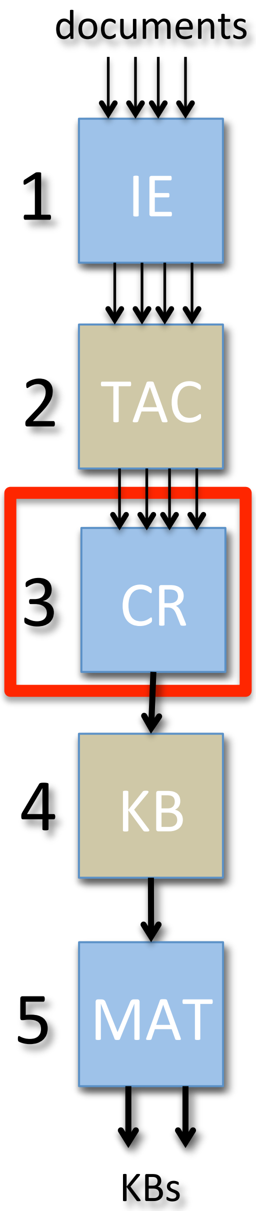


Process Concrete objects in parallel to:

- **Integrate** data from tools (e.g., Stanford, Serif)
- **Fix problems**, e.g., trim mentions, find missed mentions, deconflict tangled mention chains, …
- Extract relations from **events** (life.born => date and place of birth)
- Map schema to extended **TAC ontology**

30K ENG: 430K entities; 1.8M relations

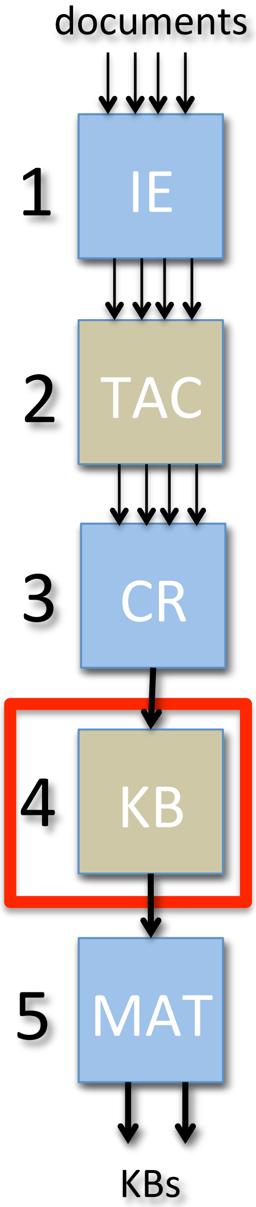
3 Kripke: Cross-Doc Coref



- Cross-document **co-reference** creates initial KB from a set of single-document KBs
  - Identify that *Barack Obama* entity in DOC32 is same individual as *Obama* in DOC342, etc.
- **Language agnostic**; works well for ENG, CMN, SPA document collections
- Only uses entity **mention strings**
- Untrained, agglomerative **clustering**

30K ENG: 210K entities; 1.2M relations

4 Inference and adjudication



documents

1 IE

2 TAC

3 CR

4 KB

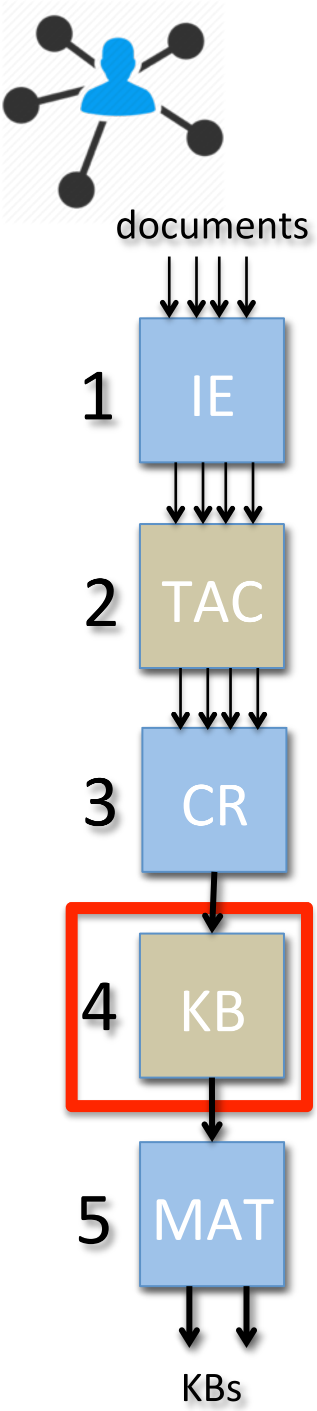
5 MAT

KBs

Reasoning to

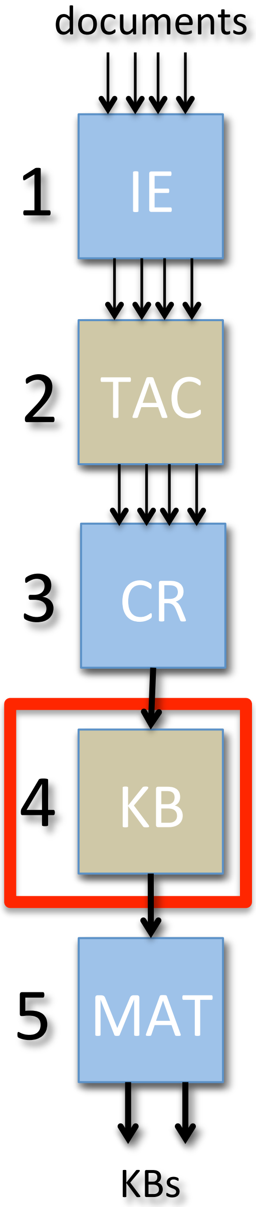
- Delete relations violating ontology constraints
  - *Person can't be born in an organization*
  - *Person can't be her own parent or spouse*
- Infer missing relations
  - *Two people sharing a parent are siblings*
  - *X born in place P_1, P_1 part of P_2 => X born in P_2*
  - *Person probably citizen of their country of birth*
  - *A CFO is a per:top_level_employee*

Entity Linking



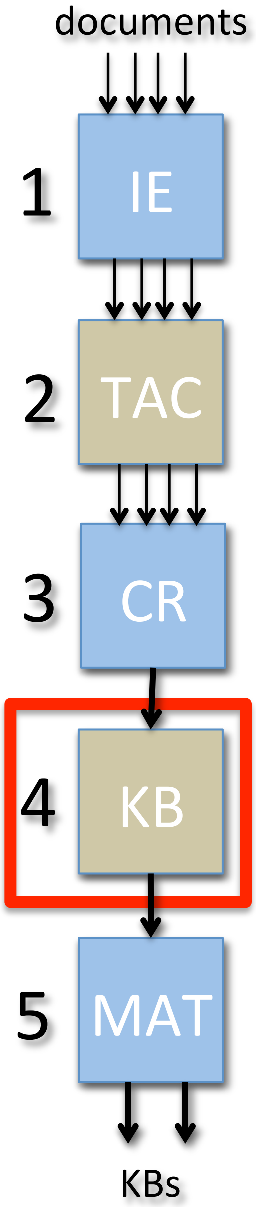
- Try to links entities to reference KB, a subset of Freebase in 2016 with
  - ~4.5M entities and ~150M triples
  - Names and text in English, Spanish and Chinese
- Don't link if no matches, poor matches or ambiguous matches

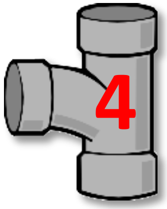
KB-level merging rules



- Merge entities of same type linked to same KB entity
- Merge cities in same region with same name
- Highly discriminative relations give evidence of sameness
  - per:spouse is few to few
  - org:top_level_employee is few to few
- Merge PERs with similar names who were
  - Both married to the same person, or
  - Both CEOs of the same company, or …

Slot Value Consolidation

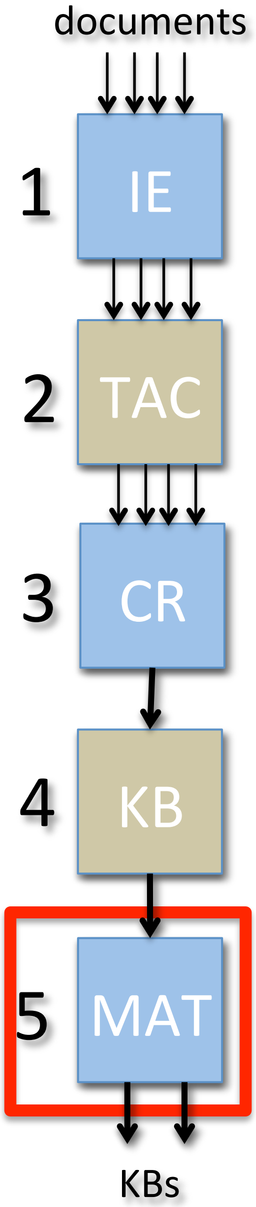


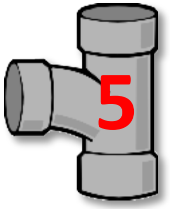


- **Problem:** too many values for some slots, especially for ‘popular’ entities, e.g.
  - – An entity with four different *per:age* values
  - – Obama has ~100 *per:employee_of* values
- **Strategy:** rank values and select best
  - – Rank values by # of attesting docs and probability
  - – Choose best N value depending on relation type

30K ENG: 183K entities; 2.1M relations

Materialize KB versions



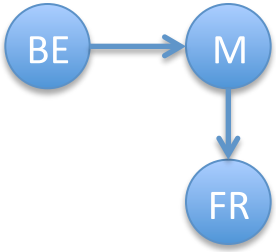


- Encode KB in your favorite database or graph store
- We like the RDF/OWL Semantic Web technology stack

Multilingual KBP

- Many examples where facts from different languages combine to answer queries or support inference

  Q: Who lives in the same city as *Bodo Elleke*?
  A: *Frank Ribery* aka *Franck Ribéry* aka 里贝里



- Why we know both live in Munich:

1. :e8 gpe:residents_of_city :e23 ENG_3:3217-3235
   ...said the younger **Bodo Elleke**, who was born in Schodack in 1930 and is now a retired architect **who lives in Munich**.
2. :e8 gpe:residents_of_city :e25 CMN...0UTJ:292-361
   拉霍伊在接受西班牙国家电台的采访时肯定，今年的三位金球奖热门候选人中，梅西“度过了一个出色的赛季”，而拜仁**慕尼黑球员里贝里**则“赢得了一切”

- Kripke merged entities with mentions *Frank Ribery*, *Franck Ribéry* & 里贝里

2016 TAC KBP Results

For the 2016 KBP submissions, depending on metric, we placed

- 1st or 2nd on XLING and were the only team to do all three languages
- 2nd or 4th on ENG depending on metric
- 1st or 2nd on CMN depending on metric
- We did poorly on SPA, finding few relations

Lots of room for improvement for both *precision* and *recall*

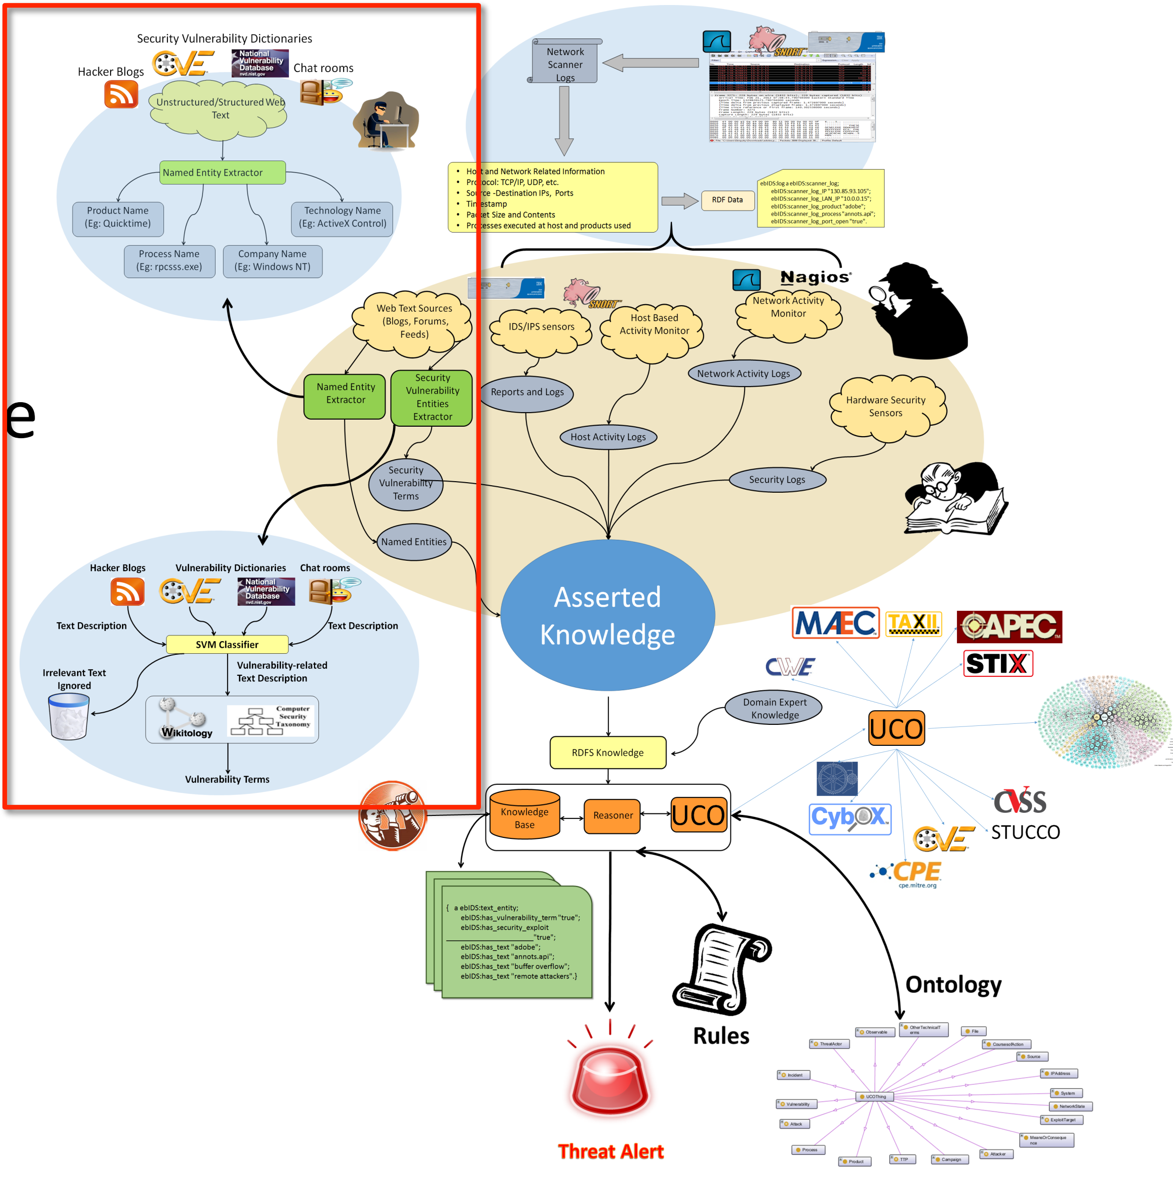
An application:
Cybersecurity strings to things

UMBC is working with IBM to develop systems to extract cybersecurity information from text

- **Find** entities and their properties, relations & events
- **Encode** as knowledge graphs with *evidence* & *certainty*
- **Recognize** entities & events referring to same things and **link** to background knowledge graphs if possible
- **Reason** over graphs to improve and assess accuracy, coherence and trustworthiness
- **Support** analytics and machine learning systems

Cyber situational awareness

- Most IDS systems are point-based & driven by known signatures
- Our situationally-aware system maps multiple sensors to a common ontology,
- Reasons over the resulting knowledge,
- Detecting possible intrusions missed by standard systems



- Host and Network Related Information
- Protocol: TCP/IP, UDP, etc.
- Source -Destination IPs, Ports
- Timestamp
- Packet Size and Contents
- Processes executed at host and products used

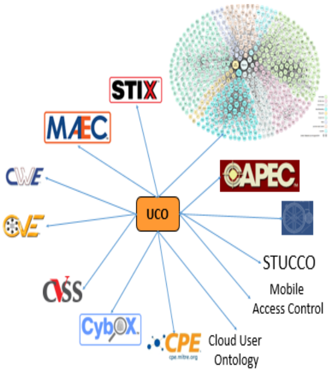
```
ebIDS:log a ebIDS:scanner_log;
     ebIDS:scanner_log_IP "130.85.93.105";
     ebIDS:scanner_log_LAN_IP "10.0.0.15";
     ebIDS:scanner_log_product "adobe";
     ebIDS:scanner_log_process "annots.api";
     ebIDS:scanner_log_port_open "true".
```

```
{   a ebIDS:text_entity;
       ebIDS:has_vulnerability_term "true";
       ebIDS:has_security_exploit
_________________________"true";
       ebIDS:has_text "adobe";
       ebIDS:has_text "annots.api";
       ebIDS:has_text "buffer overflow";
       ebIDS:has_text "remote attackers".}
```

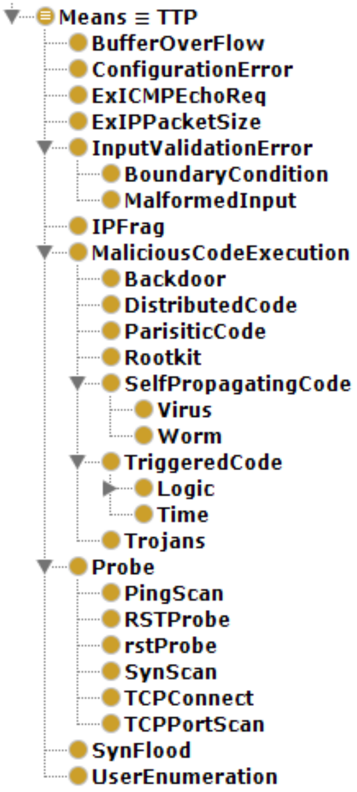
Approach

- **Leverage** existing and new tools for information extraction, semantic similarity, inference, etc.
- Evolve our **Unified Cyber Ontology** as the underlying semantic model
- Develop, curate & annotate **cybersecurity corpora** from alerts, newswire, social media & chatrooms
- **Train systems** for knowledge graph population, concept spotting, entity recognition, relation and event extraction, word embeddings, topic modeling, etc.

Unified Cybersecurity Ontology



- Common semantic model for cyber-security domain
  - Data sharing, interoperability, integration and human understanding
  - Links to background knowledge graphs
  - Maps to common metadata schemas like Stix and Cybox
- Uses semantically rich representation
  - Grounded in formal semantics
- Supports reasoning
  - Infer/retrieve new information & detect dubious facts



- Means ≡ TTP
  - BufferOverFlow
  - ConfigurationError
  - ExICMPEchoReq
  - ExIPPacketSize
  - InputValidationError
    - BoundaryCondition
    - MalformedInput
  - IPFrag
  - MaliciousCodeExecution
    - Backdoor
    - DistributedCode
    - ParisiticCode
    - Rootkit
    - SelfPropagatingCode
      - Virus
      - Worm
    - TriggeredCode
      - Logic
      - Time
    - Trojans
  - Probe

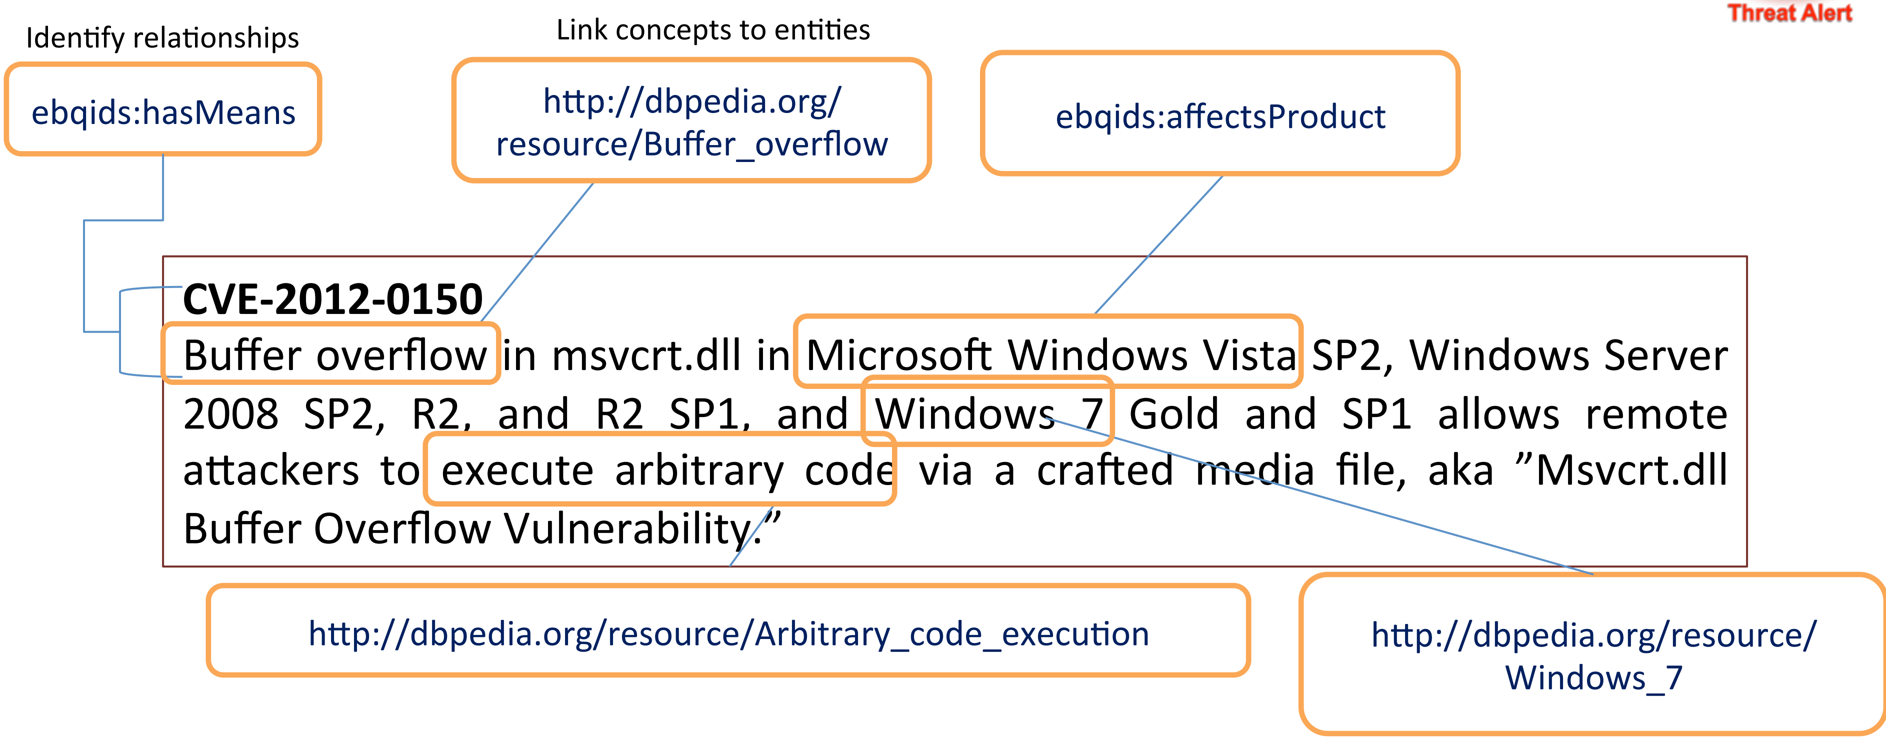
Information extraction from text



Identify relationships

ebqids:hasMeans

Link concepts to entities

http://dbpedia.org/resource/Buffer_overflow

ebqids:affectsProduct

CVE-2012-0150
Buffer overflow in msvcrt.dll in Microsoft Windows Vista SP2, Windows Server 2008 SP2, R2, and R2 SP1, and Windows 7 Gold and SP1 allows remote attackers to execute arbitrary code via a crafted media file, aka ”Msvcrt.dll Buffer Overflow Vulnerability.”

http://dbpedia.org/resource/Arbitrary_code_execution

http://dbpedia.org/resource/Windows_7

- We use information extraction techniques to identify entities, relations and concepts in security related text
- These are mapped to terms in our ontology and the DBpedia knowledge base extracted from Wikipedia

http://ebiq.org/p/540

Conclusion

- KGs help in extracting information from text
- The information extracted can update the KGs
- The KGs provide support for new tasks, such as question answering, speech interfaces and produce data useful in applications, like IDSs
- There use will grow and evolve in the future
- New machine learning frameworks will result in better accuracy
