Recap from last time...

Maximum Entropy (Log-linear) Models

$$p(y | x) \propto \exp(\theta^T f(x, y))$$

“model the posterior probabilities of the K classes via linear functions in θ , while at the same time ensuring that they sum to one and remain in $[0, 1]$ ” ~

Ch 4.4

*“[The log-linear estimate] is the least biased estimate possible on the given information; i.e., it is **maximally noncommittal with regard to missing information.**” Jaynes, 1957*

Normalization for Classification

$$Z =$$

$$\sum_{\text{label } y} \exp(\begin{array}{l} \text{weight}_1 * f_1(\text{fatally shot}, y) \\ \text{weight}_2 * f_2(\text{seriously wounded}, y) \\ \text{weight}_3 * f_3(\text{Shining Path}, y) \\ \dots \end{array} + + +)$$

Connections to Other Techniques

Log-Linear Models

(Multinomial) logistic regression

Softmax regression

Maximum Entropy models (MaxEnt)

Generalized Linear Models

Discriminative Naïve Bayes

Very shallow (sigmoidal) neural nets

$$y = \sum_k \theta_k x_k + b$$

the *response* can be a general (transformed) version of another *response*

logistic regression

$$\frac{\log p(x = i)}{\log p(x = K)} = \sum_k \theta_k f(x_k, i) + b$$

Log-Likelihood Gradient

Each component k is the difference
between:

the total value of feature f_k in the
training data

$$\sum_i f_k(x_i, y_i)$$

and

the total value the current model p_θ
thinks it computes for feature f_k

$$\sum_i \mathbb{E}_{y' \sim p}[f(x_i, y')]$$

Outline

Neural networks: non-linear classifiers

Learning weights: backpropagation of error

Autodifferentiation (in reverse mode)

Sigmoid

$$\sigma(v) = \frac{1}{1 + \exp(-sv)}$$

Sigmoid

$$\sigma(v) = \frac{1}{1 + \exp(-sv)}$$

$$\frac{\partial \sigma(v)}{\partial v} = s * \sigma(v) * (1 - \sigma(v))$$

calc practice: verify for yourself

Remember Multi-class Linear Regression/Perceptron?

Linear Regression/Perceptron: A Per-Class View

*binary version is
special case*

Logistic Regression/Classification

Logistic Regression/Classification

Q: Why didn't our maxent formulation from last class have multiple weight vectors?

Logistic Regression/Classification

Q: Why didn't our maxent formulation from last class have multiple weight vectors?

A: Implicitly it did. Our formulation was
 $y \propto \exp(w^T f(x, y))$

Stacking Logistic Regression

Goal: you still want to predict y

Idea: Can making an initial round of separate (independent) *binary* predictions h help?

Stacking Logistic Regression

Stacking Logistic Regression

Stacking Logistic Regression

Stacking Logistic Regression

Stacking Logistic Regression

Multilayer Perceptron, a.k.a. Feed-Forward Neural Network

Feed-Forward Neural Network

Why Non-Linear?

$$y_j = G(\beta_j^T h + b_1)$$

$$y_j = G\left(\beta_j^T \left(F(w_i^T x + b_0)\right)_i\right)$$

Feed-Forward

information/
computation flow

no self-loops
(recurrence/reuse of weights)

A Neural Network is a Machine Learning System...

A Neural Network is a Machine Learning System...

A Neural Network is a Machine Learning System...

Why “Neural?”

argue from neuroscience perspective

neurons (in the brain) receive input and “fire”
when sufficiently excited/activated

Universal Function Approximator

Theorem [Kurt Hornik et al., 1989]: Let F be a continuous function on a bounded subset of D -dimensional space. Then there exists a two-layer network G with finite number of hidden units that approximates F arbitrarily well. For all x in the domain of F , $|F(x) - G(x)| < \varepsilon$

“a two-layer network can approximate any function”

Going from one to two layers dramatically improves the representation power of the network

How Deep Can They Be?

So many choices:

Architecture

of hidden layers

of units per hidden layer

Computational Issues:

Vanishing gradients

Gradients shrink as one moves away from the output layer

Convergence is slow

Opportunities:

Training deep networks is an active area of research

Layer-wise initialization (perhaps using unsupervised data)

Engineering: GPUs to train on massive labelled datasets

Some Results: Digit Classification

FIGURE 11.10. Architecture of the five networks used in the ZIP code example.

FIGURE 11.11. Test performance curves, as a function of the number of training epochs, for the five networks of Table 11.1 applied to the ZIP code data.

(similar to MNIST in A2, but
not exactly the same)

Tensorflow Playground

<http://playground.tensorflow.org>

Experiment with small (toy) data neural networks in your browser

Feel free to use this to gain an intuition

Dropout: Regularization in Neural Networks

Dropout: Regularization in Neural Networks

Dropout: Regularization in Neural Networks

Dropout: Regularization in Neural Networks

tanh Activation

$$\begin{aligned}\tanh_s(x) &= \frac{2}{1 + \exp(-2 * s * x)} - 1 \\ &= 2\sigma_s(x) - 1\end{aligned}$$

Rectifiers Activations

Outline

Neural networks: non-linear classifiers

Learning weights: backpropagation of error

Autodifferentiation (in reverse mode)

Empirical Risk Minimization

Cross entropy loss

$$\ell^{\text{xent}}(\vec{y}^*, y) = - \sum_k \vec{y}^*[k] \log p(y = k)$$

mean squared
error/L2 loss

$$\ell^{\text{L2}}(y^*, y) = (y^* - y)^2$$

squared expectation
loss

$$\ell^{\text{sq-expt}}(\vec{y}^*, y) = \|\vec{y}^* - p(y)\|_2^2$$

hinge loss

$$\ell^{\text{hinge}}(\vec{y}^*, y) = \max \left\{ 0, 1 + \max_{j \neq y^*} (y[j] - \vec{y}^*[j]) \right\}$$

Gradient Descent: Backpropagate the Error

Set $t = 0$

Pick a starting value θ_t

Until converged:

for example(s) i :

1. Compute loss l on x_i
2. Get gradient $g_t = l'(x_i)$
3. Get scaling factor ρ_t
4. Set $\theta_{t+1} = \theta_t - \rho_t * g_t$
5. Set $t += 1$

(mini)batch

epoch

epoch: a single run over all training data

(mini-)batch: a run over a subset of the data

Flavors of Gradient Descent

“Online”

Set $t = 0$

Pick a starting value θ_t

Until converged:

for example i in full data:

1. Compute loss l on x_i

2. **Get** gradient

$$g_t = l'(x_i)$$

3. Get scaling factor ρ_t

4. Set $\theta_{t+1} = \theta_t - \rho_t * g_t$

5. Set $t += 1$

done

“Minibatch”

Set $t = 0$

Pick a starting value θ_t

Until converged:

get batch $B \subset$ full data

set $g_t = 0$

for example(s) i in **B**:

1. Compute loss l on x_i

2. **Accumulate** gradient

$$g_t += l'(x_i)$$

done

Get scaling factor ρ_t

Set $\theta_{t+1} = \theta_t - \rho_t * g_t$

Set $t += 1$

“Batch”

Set $t = 0$

Pick a starting value θ_t

Until converged:

set $g_t = 0$

for example(s) i in **full data**:

1. Compute loss l on x_i

2. **Accumulate** gradient

$$g_t += l'(x_i)$$

done

Get scaling factor ρ_t

Set $\theta_{t+1} = \theta_t - \rho_t * g_t$

Set $t += 1$

Gradients for Feed Forward Neural Network

$$y_k = \sigma \left(\beta_k^T \underbrace{\left(\sigma(w_j^T x + b_0) \right)}_{h: \text{a vector}} \right)_j$$

$$\mathcal{L} = - \sum_k \vec{y}^*[k] \log y_k$$

$$\frac{\partial \mathcal{L}}{\partial \beta_{kj}} = \frac{-1}{y_{y^*}} \frac{\partial y_{y^*}}{\partial \beta_{kj}}$$

$$\frac{\partial \mathcal{L}}{\partial w_{jl}}$$

Gradients for Feed Forward Neural Network

$$y_k = \sigma \left(\beta_k^T \underbrace{\left(\sigma(w_j^T x + b_0) \right)}_{h: \text{a vector}} \right)_j \quad \mathcal{L} = - \sum_k \vec{y}^*[k] \log y_k$$

$$\frac{\partial \mathcal{L}}{\partial \beta_{kj}} = \frac{-1}{y_{y^*}} \frac{\partial y_{y^*}}{\partial \beta_{kj}} = \frac{-\sigma'(\beta_{y^*}^T h)}{\sigma(\beta_{y^*}^T h)} \frac{\partial \beta_k^T h}{\partial \beta_{kj}}$$

$$\frac{\partial \mathcal{L}}{\partial w_{jl}}$$

Gradients for Feed Forward Neural Network

$$y_k = \sigma \left(\beta_k^T \underbrace{\left(\sigma(w_j^T x + b_0) \right)}_{h: \text{a vector}} \right)_j \quad \mathcal{L} = - \sum_k \vec{y}^*[k] \log y_k$$

$$\frac{\partial \mathcal{L}}{\partial \beta_{kj}} = \frac{-1}{y_{y^*}} \frac{\partial y_{y^*}}{\partial \beta_{kj}} = \frac{-\sigma'(\beta_{y^*}^T h)}{\sigma(\beta_{y^*}^T h)} \frac{\partial \beta_k^T h}{\partial \beta_{kj}} = \frac{-\sigma'(\beta_{y^*}^T h)}{\sigma(\beta_{y^*}^T h)} \frac{\partial \sum_j \beta_{y^*j} h_j}{\partial \beta_{kj}}$$

$$\frac{\partial \mathcal{L}}{\partial w_{jl}}$$

Gradients for Feed Forward Neural Network

$$y_k = \sigma \left(\beta_k^T \underbrace{\left(\sigma(w_j^T x + b_0) \right)}_{h: \text{a vector}} \right) \quad \mathcal{L} = - \sum_k \vec{y}^*[k] \log y_k$$

$$\begin{aligned} \frac{\partial \mathcal{L}}{\partial \beta_{kj}} &= \frac{-1}{y_{y^*}} \frac{\partial y_{y^*}}{\partial \beta_{kj}} = \frac{-\sigma'(\beta_{y^*}^T h)}{\sigma(\beta_{y^*}^T h)} \frac{\partial \beta_k^T h}{\partial \beta_{kj}} = \frac{-\sigma'(\beta_{y^*}^T h)}{\sigma(\beta_{y^*}^T h)} \frac{\partial \sum_j \beta_{y^*j} h_j}{\partial \beta_{kj}} \\ &= \left(1 - \sigma(\beta_{y^*}^T h) \right) h_j \end{aligned}$$

$$\frac{\partial \mathcal{L}}{\partial w_{jl}} = \left(1 - \sigma(\beta_{y^*}^T h) \right) (\beta_{y^*j} \sigma'(w_j^T x) x_l)$$

Gradients for Feed Forward Neural Network

$$y_k = \sigma \left(\beta_k^T \underbrace{\left(\sigma(w_j^T x + b_0) \right)}_{h: \text{a vector}} \right)_j \quad \mathcal{L} = - \sum_k \vec{y}^*[k] \log y_k$$

$$\frac{\partial \mathcal{L}}{\partial \beta_{kj}} = \left(1 - \sigma(\beta_{y^*}^T h) \right) h_j$$

$$\frac{\partial \mathcal{L}}{\partial w_{jl}} = \left(1 - \sigma(\beta_{y^*}^T h) \right) (\beta_{y^*j} \sigma'(w_j^T x) x_l)$$

Debugging can be hard to do!

Gradients for Feed Forward Neural Network

$$y_k = \sigma \left(\beta_k^T \underbrace{\left(\sigma(w_j^T x + b_0) \right)}_{h: \text{a vector}} \right)_j$$

$$\frac{\partial \mathcal{L}}{\partial \beta_{kj}} = \left(1 - \sigma(\beta_{y^*}^T h) \right) h_j$$

$$\frac{\partial \mathcal{L}}{\partial w_{jl}} = \left(1 - \sigma(\beta_{y^*}^T h) \right) (\beta_{y^*j} \sigma'(w_j^T x) x_l)$$

Debugging can be hard to do!

Outline

Neural networks: non-linear classifiers

Learning weights: backpropagation of error

Autodifferentiation (in reverse mode)

Finding Gradients

$$f(x_1, x_2) = x_1^2 + (x_1 - x_2)^a - \log(x_1^2 + x_2^2)$$

what are the partial derivatives?

Finding Gradients

$$f(x_1, x_2) = x_1^2 + (x_1 - x_2)^a - \log(x_1^2 + x_2^2)$$

$$\frac{\partial f(x_1, x_2)}{\partial x_1} = 2x_1 + a(x_1 - x_2)^{a-1} - \frac{2x_1}{x_1^2 + x_2^2}$$

Finding Gradients

$$f(x_1, x_2) = x_1^2 + (x_1 - x_2)^a - \log(x_1^2 + x_2^2)$$

chain rule (multiple times)

$$\frac{\partial f(x_1, x_2)}{\partial x_1} = 2x_1 + a(x_1 - x_2)^{a-1} - \frac{2x_1}{x_1^2 + x_2^2}$$

$$\frac{\partial f(x_1, x_2)}{\partial x_2} = -a(x_1 - x_2)^{a-1} - \frac{2x_2}{x_1^2 + x_2^2}$$

Autodifferentiation

$$f(x_1, x_2) = x_1^2 + (x_1 - x_2)^a - \log(x_1^2 + x_2^2)$$

$$z_1 = x_1^2$$

$$z_2 = x_2^2$$

$$z_3 = (x_1 - x_2)$$

$$z_4 = z_3^a$$

$$z_5 = z_1 + z_2$$

$$z_6 = \log z_5$$

$$z_7 = z_1 + z_4 - z_6$$

$$y = z_7$$

Autodifferentiation

$$f(x_1, x_2) = x_1^2 + (x_1 - x_2)^a - \log(x_1^2 + x_2^2)$$

$$z_1 = x_1^2$$

$$z_2 = x_2^2$$

$$z_3 = (x_1 - x_2)$$

$$z_4 = z_3^a$$

$$z_5 = z_1 + z_2$$

$$z_6 = \log z_5$$

$$z_7 = z_1 + z_4 - z_6$$

$$y = z_7$$

Outline

Neural networks: non-linear classifiers

Learning weights:
backpropagation of
error

Autodifferentiation (in
reverse mode)

Gradient Descent:

Backpropagate the Error

Set $t = 0$

Pick a starting value θ_t

Until converged:

for example(s) i :

1. Compute loss l on x_i
2. Get gradient $g_t = l'(x_i)$
3. Get scaling factor ρ_t
4. Set $\theta_{t+1} = \theta_t - \rho_t * g_t$
5. Set $t += 1$
