

# **OWL, DL, and rules**

# OWL and Rules

- Rule based systems are an important and useful way to represent and reason with knowledge
- Adding rules to OWL has been fraught with problems
- We'll look at underlying issues some approaches
  - N3 rules: TBL's early idea for extending RDF
  - SWRL: failed standard that has become widely used
  - RIF: a successful standard that's not yet widely used
  - Datalog rules: a database idea adopted by the RDFox system

# Semantic Web and Logic

- The Semantic Web is grounded in logic
- But what logic?
  - OWL Full = Classical first order logic (FOL)
  - OWL-DL = Description logic
  - N3 rules  $\sim$  = logic programming (LP) rules
  - SWRL  $\sim$  = DL + LP
  - Other choices are possible, e.g., default logic, fuzzy logic, probabilistic logics, ...
- How do these fit together and what are the consequences

# We need both structure and rules

- **OWL's ontologies** based on DL (and thus on FOL)
  - The Web is an open environment
  - Reusability / interoperability
  - An ontology is a model easy to understand
- Many **rule systems** based on logic programming
  - To achieve decidability, ontology languages don't offer the expressiveness we want. Rules do it well
  - Efficient reasoning support already exists
  - Rules are well-known and often more intuitive

# Description Logics vs. Horn Logic

- Neither is a subset of the other
- Impossible in OWL DL: people who study and live in same city are local students
- Easily done with a a rule  
 $\text{studiesAt}(X,U), \text{loc}(U,L), \text{lives}(X,L) \rightarrow \text{localStud}(X)$
- Impossible in horn rules: every person is either a man or a woman
- Easily done in OWL DL:  
`:Person owl:disjointUnionOf (:Man :Woman).`

# Non-ground entailment (1)

- Logic programming semantics defined in terms of minimal Herbrand model, i.e., sets of ground facts
- Because of this, LP horn clause reasoners can not derive rules, so that can not do general subsumption reasoning
  - i.e., can only reason about atomic facts to infer new facts
  - can't reason about rules and complex facts to create new rules

## Non-ground entailment (2)

- A horn-clause reasoner can't do the following
- Given
  - $\text{animal}(?X) \wedge \text{disease}(?D) \wedge \text{has}(?X,?D) \rightarrow \text{sickAnimal}(?x)$
  - $\text{dog}(?X) \rightarrow \text{animal}(?X)$
  - $\text{disease}(\text{rabies})$
- Derive a new rule
  - $\text{dog}(?X), \text{has}(?X, \text{rabies}) \rightarrow \text{sickAnimal}(?X)$
- Even though it follows from the underlying logic

# Decidability

- The largest obstacle!
  - Tradeoff between expressiveness and decidability
- Facing decidability issues from
  - In **Logic Programming**: finiteness of the domain
  - In **classical logic** (and thus in Description Logic): combination of constructs
- **Problem:**

Combination of “simple” DLs and Horn Logic are undecidable. (Levy & Rousset, 1998)

# SWRL: Semantic Web Rule Language

- SWRL is the **union** of DL and horn logic + many built-in functions (e.g., for math)
- Submitted to W3C in 2004, but failed to become a recommendation (led to RIF)
- Problem: full SWRL specification leads to undecidability in reasoning
- SWRL is well-specified & subsets widely supported (e.g., in OWL reasoners Pellet and HermiT)
- Based on OWL: rules use terms for OWL concepts (classes, properties, individuals, literals...)

# SWRL

- OWL classes are unary predicates, properties are binary ones
  - sibling(?p,?s) ^ Man(?s) → brother(?p,?s)
- As in Prolog, builtins can be booleans or do a computation and unify the result to a variable
  - swrlb:greaterThan(?age2, ?age1) # age2>age1
  - swrlb:subtract(?n1,?n2,?diff) # diff=n1-n2
- SWRL predicates for OWL axioms and data tests
  - differentFrom(?x, ?y), sameAs(?x, ?y), xsd:int(?x), [3, 4, 5](?x), ...

# SWRL Built-Ins

- SWRL has built-in predicate allowing for comparisons, math evaluation, string operations & more
  - Here is the [complete list](#)
- Examples
  - Person(?p), hasAge(?p, ?age), **swrlb:greaterThan**(?age, 18) -> Adult(?p)
  - Person(?p), bornOnDate(?p, ?date), **xsd:date**(?date), **swrlb:date**(?date, ?year, ?month, ?day, ?timezone) -> bornInYear(?p, ?year)
- Some reasoners (e.g., Pellet) allow you to define new built-ins in Java

# Drawbacks of full SWRL

- Main *source of complexity*:
  - arbitrary OWL expressions (e.g., restrictions) can appear in the head or body of a rule
- Adds significant expressive power to OWL, but causes *undecidability*
  - there is no inference engine that handles exactly the same conclusions as the SWRL semantics

# SWRL Sublanguages

- Challenge: identify sublanguages of SWRL with right balance between expressivity and computational viability
- A candidate OWL DL + *DL-safe rules*
  - every variable must appear in a non-description logic atom in the rule body

# DL-safe rules

- Standard reasoners support only DL-safe rules

Rule variables bind only to known individuals (i.e., OWL2 owl:NamedIndividual)

- Example

`:Vehicle(?v) ^ :Motor(?m) ^ :hasMotor(?v,?m) -> :MotorVehicle(?v)`

- Where

`:Car = :Vehicle and some :hasMotor Motor`

`:x a :Car`

A blank node!

- Reasoner won't bind ?m to a motor since it is not a known individual
- Thus, the rule cannot conclude MotorVehicle(:x)

# Protégé 5 had SWRLTab

Add/edit rules and optionally run a separate rules engine

The screenshot shows the Protégé 5 SWRLTab interface. The browser address bar displays the URL `peeps (http://ebiq.org/ontologies/peeps/)`. The main window title is `peeps (http://ebiq.org/ontologies/peeps/) : [/Users/finin/Sites/691f17/examples/owl_examples/peeps/peeps.owl]`. The interface includes a search bar and a navigation menu with tabs for `Active Ontology`, `Entities`, `Object Properties`, `Data Properties`, `Individuals by class`, and `SWRLTab`.

Name	Rule
<input checked="" type="checkbox"/> S1	<code>peeps:hasAge(?p1, ?a1) ^ peeps:hasAge(?p2, ?a2) ^ swrlb:lessThan(?a1, ?a2) -&gt; youngerThan(?p1, ?p2)</code>
<input checked="" type="checkbox"/> S2	<code>peeps:Woman(?p2) ^ peeps:hasParent(?p1, ?p2) -&gt; hasMother(?p1, ?p2)</code>

Buttons for `New`, `Edit`, `Clone`, and `Delete` are located below the table. The `Control` tab is active, showing instructions for using the Drools rule engine:

Using the Drools rule engine.

Press the 'OWL+SWRL->Drools' button to transfer SWRL rules and relevant OWL knowledge to the rule engine.  
Press the 'Run Drools' button to run the rule engine.  
Press the 'Drools->OWL' button to transfer the inferred rule engine knowledge to OWL knowledge.

The SWRLAPI supports an OWL profile called OWL 2 RL and uses an OWL 2 RL-based reasoner to perform reasoning.  
See the 'OWL 2 RL' sub-tab for more information on this reasoner.

At the bottom of the interface, there are three buttons: `OWL+SWRL->D...`, `Run Drools`, and `Drools->OWL`. A footer note states: `To use the reasoner click Reasoner > Start reasoner` with a checked `Show Inferences` checkbox.

# SWRL limitations

SWRL rules do not support many useful features of some rule-based systems

- Default reasoning
- Rule priorities
- Negation as failure (e.g., for closed-world semantics)
- Data structures
- ...

Limitations led to [RIF](#), Rule Interchange Format

# RDFox is an interesting alternative

- RDFox is an RDF database system with several interesting features
  - Supports OWL reasoning and SWRL, but also rules modeled after Datalog
  - Keeps its knowledge graph in memory
  - Uses forward chaining
  - Has a built-in truth maintenance system that removes inferred triples no longer supported

# RDFox rules

*# Most birds can fly, with some exceptions*

```
:FlyingAnimal[?X] :-  
    :Bird[?X], NOT :FlightlessAnimal[?X].
```

*# penguins are birds, but no penguin can fly*

```
:Bird[?X] :- :Penguin[?X].  
:FlightlessAnimal[?X] :- :Penguin[?X].
```

*# here are some birds*

```
:Bird[:tweety].  
:Penguin[:chillyWilly].
```

# Summary

- Horn logic is a subset of predicate logic that allows efficient reasoning, orthogonal to description logics
- Horn logic is the basis of monotonic rules
- DLP and SWRL are two important ways of combining OWL with Horn rules.
  - DLP is essentially the intersection of OWL and Horn logic
  - SWRL is a much richer language

## Summary (2)

- Nonmonotonic rules are useful in situations where the available information is incomplete
- They are rules that may be overridden by contrary evidence
- Priorities are sometimes used to resolve some conflicts between rules
