## Major Computer Components

- Central Processing Unit (CPU)
- Bus
- Main Memory (RAM)
- Secondary Storage Media
- I / O Devices

3

## The CPU

- Central Processing Unit
- The “brain” of the computer
- Controls all other computer functions
- In PCs (personal computers) also called the microprocessor or simply processor.

4

## The Bus

- Computer components are connected by a bus.
- A bus is a group of parallel wires that carry control signals and data between components.

5

## Main Memory

- Main memory holds information such as computer programs, numeric data, or documents created by a **word processor**.
- Main memory is made up of **capacitors**.
- If a capacitor is charged, then its state is said to be **1**, or **ON**.
- We could also say the **bit is set**.
- If a capacitor does not have a charge, then its state is said to be **0**, or **OFF**.
- We could also say that **the bit is reset** or **cleared**.

6

## Main Memory (cont.)

- Memory is divided into **cells**, where each cell contains 8 **bits** (a 1 or a 0). Eight bits is called a **byte**.
- Each of these cells is uniquely numbered.
- The number associated with a cell is known as its **address**.
- Main memory is **volatile** storage. That is, if power is lost, the information in main memory is lost.

7

## Main Memory (cont.)

- Other computer components can
  - get the information held at a particular address in memory, known as a **READ**,
  - or store information at a particular address in memory, known as a **WRITE**.
- Writing to a memory location alters its contents.
- Reading from a memory location does not alter its contents.

8

## Main Memory (cont.)

- All addresses in memory can be accessed in the same amount of time.
- We do not have to start at address 0 and read everything until we get to the address we really want (**sequential access**).
- We can go directly to the address we want and access the data (**direct or random access**).
- That is why we call main memory **RAM (Random Access Memory)**.

9

## Secondary Storage Media

- Disks -- floppy, hard, removable (random access)
- Tapes (sequential access)
- CDs (random access)
- DVDs (random access)
- Secondary storage media store files that contain
  - computer programs
  - data
  - other types of information
- This type of storage is called persistent (permanent) storage because it is non-volatile.

10

## I/O (Input/Output) Devices

- Information input and output is handled by I/O (input/output) devices.
- More generally, these devices are known as peripheral devices.
- Examples:
  - monitor
  - keyboard
  - mouse
  - disk drive (floppy, hard, removable)
  - CD or DVD drive
  - printer
  - scanner

11

## Bits, Bytes, and Words

- A **bit** is a single binary digit (a 1 or 0).
- A **byte** is 8 bits
- A word is 32 bits or 4 bytes
- Long word = 8 bytes = 64 bits
- Quad word = 16 bytes = 128 bits
- Programming languages use these standard number of bits when organizing data storage and access.
- What do you call 4 bits?  
(hint: it is a small byte)

12

## Number Systems

- The on and off states of the capacitors in RAM can be thought of as the values 1 and 0, respectively.
- Therefore, thinking about how information is stored in RAM requires knowledge of the binary (base 2) number system.
- Let's review the decimal (base 10) number system first.

13

## The Decimal Number System

- The decimal number system is a positional number system.
- Example:

$$\begin{array}{rcccc}
 5 & 6 & 2 & 1 \\
 10^3 & 10^2 & 10^1 & 10^0
 \end{array}
 \qquad
 \begin{array}{r}
 1 \times 10^0 = 1 \\
 2 \times 10^1 = 20 \\
 6 \times 10^2 = 600 \\
 5 \times 10^3 = 5000
 \end{array}$$

14

## The Decimal Number System

- The decimal number system is also known as base 10. The values of the positions are calculated by taking 10 to some power.
- Why is the base 10 for decimal numbers?
  - Because we use 10 digits, the digits 0 through 9.

15

## The Binary Number System

- The binary number system is also known as base 2. The values of the positions are calculated by taking 2 to some power.
- Why is the base 2 for binary numbers?
  - Because we use 2 digits, the digits 0 and 1.

16

## The Binary Number System

- The binary number system is also a positional numbering system.
- Instead of using ten digits, 0 - 9, the binary system uses only two digits, 0 and 1.
- Example of a binary number and the values of the positions:

$$\begin{array}{rcccccccc}
 1 & 0 & 0 & 1 & 1 & 0 & 1 \\
 2^6 & 2^5 & 2^4 & 2^3 & 2^2 & 2^1 & 2^0
 \end{array}$$

17

## Converting from Binary to Decimal

$$\begin{array}{rcccccccc}
 1 & 0 & 0 & 1 & 1 & 0 & 1 \\
 2^6 & 2^5 & 2^4 & 2^3 & 2^2 & 2^1 & 2^0
 \end{array}
 \qquad
 \begin{array}{r}
 1 \times 2^0 = 1 \\
 0 \times 2^1 = 0 \\
 1 \times 2^2 = 4 \\
 1 \times 2^3 = 8 \\
 0 \times 2^4 = 0 \\
 0 \times 2^5 = 0 \\
 1 \times 2^6 = 64 \\
 \hline
 77_{10}
 \end{array}$$

18

## Converting from Binary to Decimal

Practice conversions:

<u>Binary</u>	<u>Decimal</u>
11101	
1010101	
100111	

19

## Converting from Decimal to Binary

- Make a list of the binary place values up to the number being converted.
- Perform successive divisions by 2, placing the remainder of 0 or 1 in each of the positions from right to left.
- Continue until the quotient is zero.
- Example:  $42_{10}$

$2^5$	$2^4$	$2^3$	$2^2$	$2^1$	$2^0$
32	16	8	4	2	1
1	0	1	0	1	0

20

## Converting from Binary to Decimal

Practice conversions:

<u>Decimal</u>	<u>Binary</u>
59	
82	
175	

21

## Working with Large Numbers

0 1 0 1 0 0 0 0 1 0 1 0 0 1 1 1 = ?

- Humans can't work well with binary numbers; there are too many digits to deal with.
- Memory addresses and other data can be quite large. Therefore, we sometimes use the **hexadecimal number system**.

22

## The Hexadecimal Number System

- The hexadecimal number system is also known as base 16. The values of the positions are calculated by taking 16 to some power.
- Why is the base 16 for hexadecimal numbers ?
  - Because we use 16 symbols, the digits 0 through 9 and the letters A through F.

23

## The Hexadecimal Number System

<u>Binary</u>	<u>Decimal</u>	<u>Hexadecimal</u>	<u>Binary</u>	<u>Decimal</u>	<u>Hexadecimal</u>
0	0	0	1010	10	A
1	1	1	1011	11	B
10	2	2	1100	12	C
11	3	3	1101	13	D
100	4	4	1110	14	E
101	5	5	1111	15	F
110	6	6			
111	7	7			
1000	8	8			
1001	9	9			

24

## The Hexadecimal Number System

- Example of a hexadecimal number and the values of the positions:

3 C 8 B 0 5 1  
 $16^6$   $16^5$   $16^4$   $16^3$   $16^2$   $16^1$   $16^0$

25

## Example of Equivalent Numbers

Binary: 1 0 1 0 0 0 0 1 0 1 0 0 1 1 1<sub>2</sub>

Decimal: 20647<sub>10</sub>

Hexadecimal: 50A7<sub>16</sub>

Notice how the number of digits gets smaller as the base increases.

26

## Converting from Binary to Hex

- Because 16 is the equivalent of  $2^4$ , it is easy to convert from binary to hex and vice-versa.
- Binary: 1101 0010 1111 0000
- Hex: 0x D 2 F 0

27

## Converting from Binary to Octal

- Octal is another number system that is base 8.
- Because 8 is the equivalent of  $2^3$ , it is easy to convert from binary to octal and vice-versa.
- Convert the following binary number to octal:
  - 01 101 001 011 110 000
