

Map Representations 2 Probabilistic Localization I

Previously and Now

- ◆ Done:
- ◆ All about kinematics
- ◆ All about transforms
- ◆ Localization
- ◆ Location error
- ◆ Movement error
- ◆ Behavior-based navigation

- ◆ Belief representations
- ◆ Map representations
- Yet to come:**
- ◆ More representation
- ◆ Probabilistic localization
- ◆ Cognition and control
- ◆ HRI
- ◆ Maze event!

Representations So Far

- ◆ Polygonal
- ◆ Line
- ◆ Topological
- ◆ Discretized

How To Build Maps

- ◆ All of these map representations are simplifications of reality
 - ◆ Easier to store
 - ◆ More intuitive (sometimes)
 - ◆ Faster to use computationally
- ◆ Simplified maps still derived from sensor data
- ◆ How do we get from rich sensor data to representations?

Decomposing Maps

- ◆ For both topo and discretized, we need a **map decomposition**
 - ◆ Break the map into areas we care about (cells)
- ◆ Important warning: In cell decompositions, **→ every point in a cell is the same as every other ←**
- ◆ Why?

Decomposing Maps: Why?

- ◆ For navigation, we mostly care about "free" (traversable) space.
- ◆ Say I want to get to the door:
 - ◆ Who cares if I'm here or here?
 - ◆ Movement isn't infinitely precise.
- ◆ If that's not precise enough, we need a different **decomposition**.
- ◆ So let's look a few choices...

Exact Cell Decomposition

9

- ◆ Subdivide a map into blocks of free space
 - ◆ Find vertices of objects in area
 - ◆ Break up map so all vertices bound cells

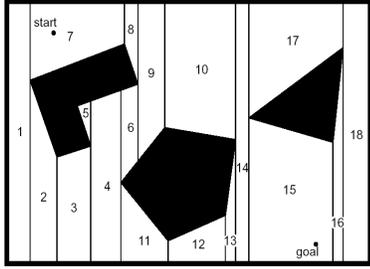

Idea:

- ◆ It matters how a robot can traverse free cells
- ◆ Exact position doesn't matter

Exact Cell Decomposition

10

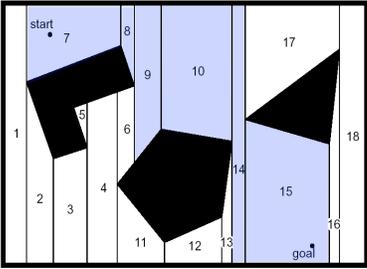

Navigation through Exact Cells

11

- ◆ Sequence: 7, 8, 9, 10, 14, 15

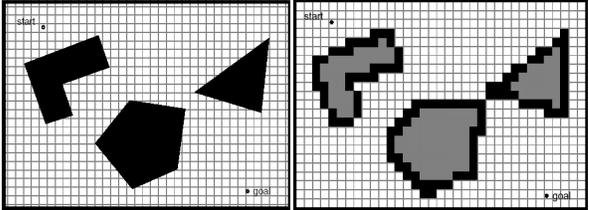

Fixed Cell Decomposition

12

- ◆ Use a fixed size grid overlaid on space
- ◆ Problem: Narrow passages disappear!

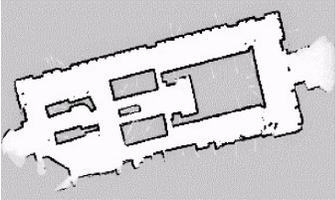

Tiny Fixed Cells

13

- ◆ Fixed cell decomposition – Example with very small cells
- ◆ Expensive
 - ◆ Reduces some of the efficiency of decomposed maps

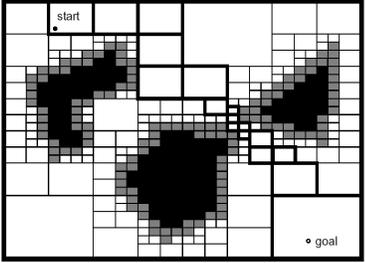

Courtesy of S. Thrun

Adaptive Cell Decomposition

14

- ◆ Use the size cell you need to represent features

Topo Decomposition

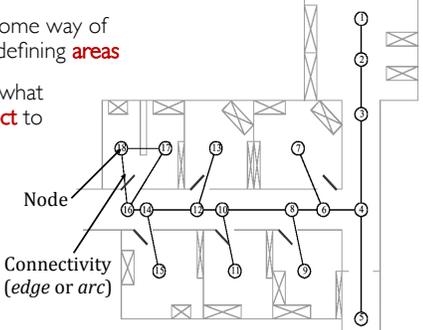

16

- ◆ Must have some way of identifying/ defining **areas**
- ◆ Must know what areas **connect** to create arcs
- ◆ Must know what node robot is in

Node

Connectivity
(edge or arc)

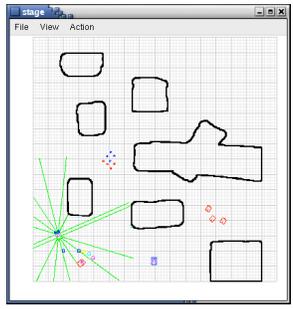

Occupancy Grid

18

- ◆ Each grid cell is marked as occupied or unoccupied
- ◆ Robot is in known area in grid
- ◆ Generally created on the fly from range sensing data

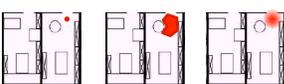

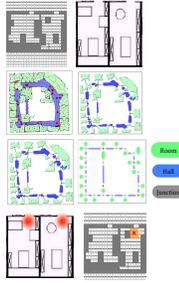

Representation Review

23

- ◆ Characterizing maps
 - ◆ Discrete vs. continuous
 - ◆ Geometric vs. topological
 - ◆ Semantically labeled vs. unlabeled
- ◆ Characterizing beliefs (location)
 - ◆ Discrete vs. continuous
 - ◆ Single vs. multiple hypothesis
 - ◆ Point, bounding box, probability function

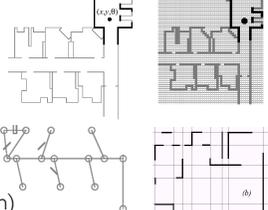

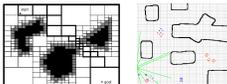

Map Representation Review

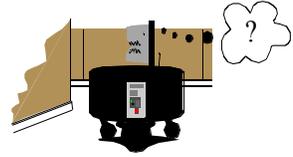

24

- ◆ Precision
- ◆ Types of representation:
 - ◆ Continuous line
 - ◆ Grid
 - ◆ Topological
 - ◆ Line extraction
- ◆ Decomposition (discretization)
 - ◆ Grid-based
 - ◆ Topological

Probability & Localization

where am I (most likely)?

Current Challenges

26

- ◆ Real world is dynamic
 - ◆ People move, couches move, walls move...
- ◆ Perception is still a major challenge
 - ◆ Error prone, extraction of useful information can be difficult
- ◆ Traversal of open space is critical
- ◆ How to build up topology (boundaries of nodes)
- ◆ Sensor fusion
- ◆ So, represent map and belief state **probabilistically**

Probabilistic Map-Based Localization

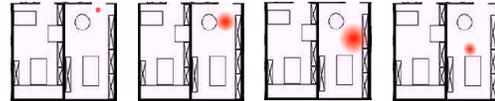

27

- ◆ Given: A mobile robot moving in known environment
 - ◆ Starts from a **known location** and tracks location using **odometry**
 - ◆ After a while robot is **very uncertain of its position**
- ➔ Update using an **observation of the environment**
- ◆ Observation gives:
 - ◆ An **estimate of robot position...**
 - ◆ Which can then be **fused with odometric estimation...**
 - ◆ To get best possible **update of robot's actual position.**

Probabilistic Localization (2)

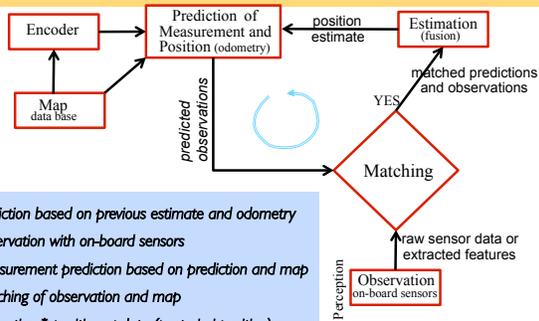

28

- ◆ Mobile robot moving in known environment
 1. Starts from known location
 2. Keeps track (maintains a belief) using odometry
 3. Over time, uncertainty about position grows
 - ➔ **Observe environment** for new estimate
 4. Fuse estimate with odometric estimation to give...
 5. Best possible belief update

Map-Based Localization

31

1. Prediction based on previous estimate and odometry
2. Observation with on-board sensors
3. Measurement prediction based on prediction and map
4. Matching of observation and map
5. Estimation * position update (posteriori position)
