Arithmetic Operators in C

Name	Operator	Example
Addition	+	num1 + num2
Subtraction	-	initial - spent
Multiplication	*	fathoms * 6
Division	/	sum / count
Modulus	%	m % n

Division

- If both operands of a division expression are integers, you will get an integer answer. The fractional portion is thrown away.

- Examples :
 $17 / 5 = 3$
 $4 / 3 = 1$
 $35 / 9 = 3$

Division (con't)

- Division where at least one operand is a **floating point number** will produce a floating point answer.

- Examples : $17.0 / 5 = 3.4$
 $4 / 3.2 = 1.25$
 $35.2 / 9.1 = 3.86813$

- What happens? The integer operand is temporarily converted to a floating point, then the division is performed.

Division By Zero

- Division by zero is mathematically undefined.
- If you allow division by zero in a program, it will cause a **fatal error**. Your program will terminate execution and give an error message.
- **Non-fatal errors** do not cause program termination, just produce incorrect results.

Modulus

- The expression **m % n** yields the integer remainder after **m** is divided by **n**.
- Modulus is an integer operation -- both operands **MUST** be integers.

- Examples : $17 \% 5 = 2$
 $6 \% 3 = 0$
 $9 \% 2 = 1$
 $5 \% 8 = 5$

Uses for Modulus

- Used to determine if an integer value is even or odd

$$5 \% 2 = 1 \rightarrow \text{odd} \quad 4 \% 2 = 0 \rightarrow \text{even}$$

If you take the modulus by 2 of an integer, a result of 1 means the number is odd and a result of 0 means the number is even.

Arithmetic Operators Rules of Operator Precedence

Operator(s)	Precedence & Associativity
()	Evaluated first. If nested (embedded) , innermost first. If on same level, left to right.
* / %	Evaluated second. If there are several, evaluated left to right
+ -	Evaluated third. If there are several, evaluated left to right.
=	Evaluated last, right to left.

Using Parentheses

- Use parentheses to change the order in which an expression is evaluated.
- $a + b * c$ Would multiply $b * c$ first, then add a to the result.
- If you really want the sum of a and b to be multiplied by c , use parentheses to force the evaluation to be done in the order you want.
 $(a + b) * c$
- Also use parentheses to clarify a complex expression.

Practice With Evaluating Expressions

Given integer variables a , b , c , d , and e ,
where $a = 1$, $b = 2$, $c = 3$, $d = 4$,
evaluate the following expressions:

$$a + b - c + d$$

$$a * b / c$$

$$1 + a * b \% c$$

$$a + d \% b - c$$

$$e = b = d + c / b - a$$

A Sample Project

□ Let's write a program that computes and displays the volume and surface area of a cube.

□ Procedure:

- Use the pseudocode that we developed in "Algorithms, Part 3 of 3"
- Convert the algorithm to code
- Clean up the code (spacing, indentation, commenting)

The Box - Pseudocode

Display "Enter the height: "

Read <height>

While (<height> <= 0)

 Display "The height must be > 0"

 Display "Enter the height: "

 Read <height>

End_while

The Box - Pseudocode (con't)

```
Display "Enter the width: "  
Read <width>  
While (<width> <= 0 )  
    Display "The width must be > 0"  
    Display "Enter the width: "  
    Read <width>  
End_while
```

The Box - Pseudocode (con't)

```
Display "Enter the depth: "  
Read <depth>  
While (<depth> <= 0 )  
    Display "The depth must be > 0"  
    Display "Enter the depth: "  
    Read <depth>  
End_while
```

The Box - Pseudocode (con't)

```
<volume> = <height> X <width> X <depth>  
  
<surface1> = <height> X <width>  
<surface2> = <width> X <depth>  
<surface3> = <height> X <depth>  
<surface area> = 2 X (<surface1> + <surface2> + <surface3>)
```

The Box - Pseudocode (con't)

- Display "Height = ", <height>
- Display "Width = ", <width>
- Display "Depth = ", <depth>
- Display "Volume = ", <volume>
- Display "Surface Area = ", <surface area>

Good Programming Practice

- It is best not to take the **"big bang"** approach to coding.
- Use an **incremental approach** by writing your code in incomplete, yet working, pieces.
- For example, for your projects,
 - Don't write the whole program at once.
 - Just write enough to display the user prompt on the screen.
 - Get that part working first (compile and run).
 - Next, write the part that gets the value from the user, and then just print it out.

Good Programming Practice

- Get that working (compile and run).
- Next, change the code so that you use the value in a calculation and print out the answer.
- Get that working (compile and run).
- Continue this process until you have the final version.
- Get the final version working.

Always have a working version of your program!

Using the Incremental Approach

- Let's think about how we could have developed the volume and surface area program incrementally.
